Shoot UP Manila Event Documentation  
Request and Membership Performance  
Tracking System

A special problem in partial fulfillment  
of the requirements for the degree  
**Bachelor of Science in Computer Science**

Submitted by:

Marquee Mae A. Enriquez

May 2016

Permission is given for the following people to have access to this SP:

Available to the general public	Yes
Available only after consultation with author/SP adviser	No
Available only to those bound by confidentiality agreement	No

## ACCEPTANCE SHEET

The Special Problem entitled “Shoot UP Manila Event Documentation Request and Membership Performance Tracking System” prepared and submitted by Marquee Mae A. Enriquez in partial fulfillment to the requirements for the degree of Bachelor of Science in Computer Science has been examined and is recommended for acceptance.

## **Abstract**

The Shoot UPM Event Request and Performance Tracking System, a web-based application, uses various frameworks and libraries necessary to encapsulate all of the organization's major internal processes in an organized manner. The said technology enables the members of the organization to keep all of their event documentation processes well monitored, and have a keener and easier way to evaluate the performance of all of its members.

Keywords: Shoot UP Manila, documentation tracking, performance tracking

# **I. INTRODUCTION**

## **A. Background of the Study**

Shoot UP Manila (Shoot UPM) is the premiere and only photography and videography organization of the University of the Philippines Manila. It is a service-oriented organization that caters documentation of various events inside and outside the campus through photo and video coverage [1]. Shoot UPM currently has 57 official and active members, all engaged to the organization's primary service of event documentation. Along with this, the members of Shoot UPM also perform internal organization processes to accomplish the said primary service. These internal processes include: (1) approve or disapprove documentation requests sent to the organization, (2) assign members to teams who will document the actual event through photography and videography, (3) coordinate with the event organizers upon event coverage approval, (4) post-process the photos and videos taken for good quality, and (5) deliver the end products to the client in soft copies.

To carry out Shoot UPM's internal functions, the organization is divided into five different committees: Marketing and Publicity (13 members), Membership (11 members), Training and Development (12 members), Finance (11 members), and Current Affairs (10 members). Each committee is led by one committee head, and each committee head reports to the president for overall progress and concerns. The president, together with all committee heads consists the organization's executive committee [1]. All members of Shoot UPM are expected to not only engage themselves in the art of photography and videography, but also to work on the internal processes of the organization for it to deliver its service properly to its clients.

Illustrated below is a diagram of the organization's membership hierarchy.

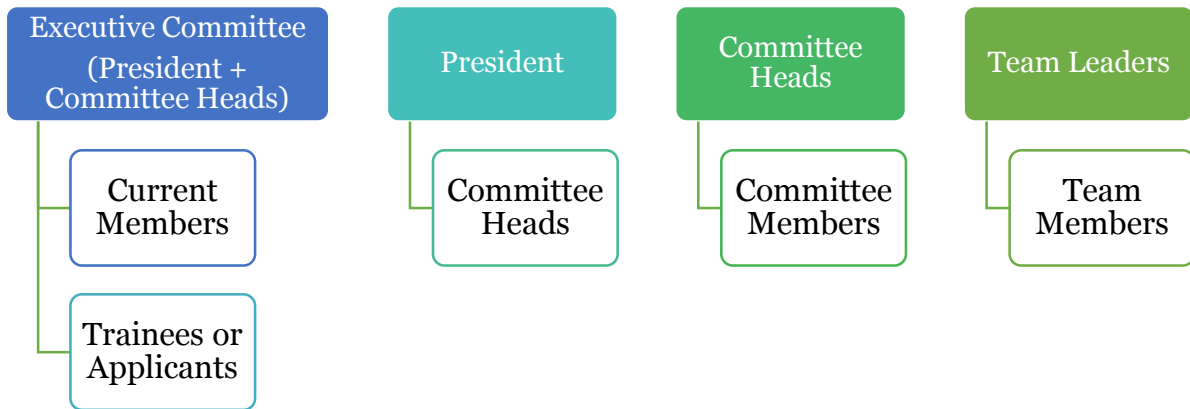

Figure 1: Diagram of Shoot UPM Hierarchical Structure

The process of event documentation begins with a request sent by a client to the organization. Shoot UPM currently uses Google Forms for its documentation request submissions. This specific form is linked on its Facebook page for public access. The said form contains the organization's terms of agreement and guidelines in covering events, preceded by details to be filled-out regarding the organizers and the event itself such as contact person details, the event's location, date, time duration, and the type of services needed for the event.

Over the course of the organization's services, some clients become unaware of the request form linked on the organization's Facebook page since bulk of the page's contents are published event photos and videos and a few other announcements. Therefore, clients resort to messaging the organization through Facebook chat or direct email for their requests and inquiries. The overall management and tracking of these requests, whether or not they are responded to immediately, becomes a tedious work given the fact that many officers are handling the Facebook page and email account as administrators to perform their own specific tasks.

Each documentation request submission will undergo event detail evaluation. If the event request meets Shoot UPM's criteria on which events they are to document, the request is approved and a team will be assigned to cover the approved event. Once

an event is assigned to a certain team, the committee heads responsible to make sure all documentations are delivered to the clients and published on the Facebook page on time have no means to monitor the progress of each event since it mainly involves the team members alone and not the executive committee members anymore.

Last A.Y. 2014 – 2015, Shoot UPM was able to document and publish 52 UP events overall, not taking into account private event coverage such as debuts and parties. These event documentations are usually situated within UP Manila and are hosted by various university organizations. The number of events booked per month varies, as it depends on the calendar of events of the whole university. But requests start to load up on the organization once the mid-semester season begins. Peaks of Shoot UPM service occurs most especially during week-long college celebrations where forums, contests, variety shows and pageants take place. These events happen on consecutive days, where each event per day requires more than one team for coverage because of the time span of the respective events. On these cases, the organization gets very loaded up and once pre-processing time kicks in, event tracking begins to get out of hand which results to late submission or publication of deliverables [2].

Other than being part of a certain committee throughout an academic year, members of Shoot UPM are also assigned to specific teams, usually consists of two to four members and one team leader, each assigned by the Membership Committee. A team leader will be notified for an event assignment, and once the team leader confirms his or her availability on the specified date and time, he or she will contact his or her team members for their confirmation. On the case when a team member is not available to cover the assigned event, he or she should find a replacement member from other teams.

After every event coverage, each team are given ten working days to filter and post process the photos and videos taken during the event before submitting to the clients and publishing online. The members of each team are also required to accomplish a teammate evaluation sheet – a set of questions on punctuality, commitment, behavior, and outputs of each team member on the specific event, which

is also managed by the Membership committee. These evaluations, together with the compliance to monthly portfolio tasks, and attendance to assemblies and workshop, are a significant part to each member's annual performance in the form of percentage points, which is being monitored by the committee as well.

The monitoring of each member's points is significant to the organization as it will serve as a basis whether or not he or she will be qualified for membership renewal for the next academic year. A member who fails to meet the percentage point requirement will be dismissed from the organization [1].

Overall, an organized way of monitoring its various processes along with proper member coordination are the main concerns of the organization given the large volume of tasks to accomplish and the limited number of members.

## **B. Statement of the Problem**

The inability of the executive committee members and team leaders to monitor the status of the organization's internal processes leads to the following issues: (a) failure to monitor whether or not all documentation requests received are evaluated and responded to, (b) failure to inform teams on time of their event assignments once event coverage piles up, (c) failure to aid members in the processing photos and videos once event coverage piles up, (d) failure to submit deliverables to clients on time because of backlog (e) failure to publish event photos and videos on Facebook once event coverage piles up. The occurrence of these problems to an extent, affects the image of the organization and the service it offers to its clients.

Also, the evaluation and recording of members' performance points throughout the academic year are done manually, which requires more effort and time from the committee members assigned to manage it. Therefore, the committee fails to update the members' progress on a regular basis because of the volume of evaluations each member get after every event coverage. This further affects the members because it disables them to monitor their performance points as needed and fail to know whether

or not there are points of improvement they need to focus on to maintain good standing in the organization.

### **C. Objectives of the Study**

To address the organization's concern to monitor its processes and member coordination, as well as to utilize maximum manpower, the Shoot UPM Documentation Request and Membership Progress Tracking System is proposed. The objective of the study is to create a web-based system for the Shoot UPM members to monitor the progress and status of all of its internal tasks, from documentation request submissions to members' performance evaluations.

The system will implement a documentation request form where clients can submit their requests or query any concerns to the organization. Each request or query sent by the client will then be inputted to a list of events. Every entry will enable committee heads or team leaders to monitor and update, respectively, the event's status depending on the progress point of the documentation request until the whole process is finished.

The system also aims to implement an evaluation form and performance tracking system where members can submit their evaluations every after an event and see their progress points throughout the year.

Specific features of the proposed Shoot UPM Event Request and Progress Tracking System includes the following actions:

1. Allow members to:
  - (a) Access list of events
  - (b) Confirm attendance to an event coverage
  - (c) Post announcements
  - (d) View progress of events he or she is assigned to
  - (e) Accomplish and submit member/leader evaluation per event
  - (f) Access own performance record
  - (g) Add/update personal information for the organization's directory.

These information include:

- i. General information
  - ii. Photography and videography gear(s)
- (h) Access the members' information directory
  
- 2. Allow team leaders to:
  - (a) Have the same actions as a regular member
  - (b) Update the progress of the event assigned to his or her team on the events list. These progress points include the following:
    - i. Contacted client
    - ii. Covered event
    - iii. Processed photos and videos
    - iv. Submitted deliverables to clients
    - v. Submitted photos and videos for publishing
    - vi. Accomplished team evaluation forms (complete process)
  
- 3. Allow executive committee members to:
  - (a) Have the same actions as a regular member
  - (b) Access and respond to client's documentation requests
  - (c) Access and respond to client's queries
  - (d) Assign team(s) to an event
  - (e) View progress of all events in the list
  - (f) View members' evaluations
  - (g) View members' performance score and progress
  
- 4. Allow clients to:
  - (a) Submit documentation requests forms
  - (b) Submit questions/queries to the organization
  
- 5. Allow system administrator to:
  - (a) Manage member accounts
  - (b) Manage teams and its members

#### **D. Significance of the Study**

The proposed Shoot UPM Documentation Request and Membership Progress Tracking System can enable members of the organization to monitor the progress of each documentation request currently being processed. With the system's tracking feature, the executive committee can easily (a) monitor and respond to all documentation requests submitted to the organization, (b) update and double check all team assignments to each event regardless of piled up documentation requests, (c) monitor and ensure photo and video post-processing meets specific due dates, (d) monitor all deliverables' status and submit them to clients on time, and (e) ensure all deliverables are published online regardless of piled up events.

The system can also allow members to access their performance points any time they want to help them know on the possible fields they need to improve their performances within the organization. An automated performance tracker can also aid the Membership committee, assigned to evaluate and calculate the performances of each of the members, to avoid manual work on evaluating and recording each of the member's points.

The existence of a dedicated system for all of the organization's internal processes can also account for monitoring and managing its members, whether members' accounts are still to be active next school year if they are renewed as members or not. This is to be regulated by the administrator of the system.

#### **E. Scope and Limitations**

1. The executive committee members will be given higher hierarchical access, giving them access to more functionalities than regular members only.
2. Non-executive committee members of the organization have view access to the list of events that are only assigned to him/her.
3. The only feature of the system accessible to the public (non-account owners) will be the documentation request form and inquiry form where the client will have to indicate his or her contact details to wait for the confirmation from the organization.

4. The decision making on whether a documentation request will be accepted or rejected is not covered by the system. This assessment depends on the consensus of the executive committee members.

#### **F. Assumptions**

1. Only official members of organization, Shoot UP Manila, will be given accounts to access their own list of events and track their points and performance throughout the year. These accounts will be given directly by the system administrator.
2. Legal and professional event, or events that do not violate any laws or social constructs, are submitted and involved in the event documentation process.

## **II. REVIEW OF RELATED LITERATURE**

Incident management systems or ticket management systems have been widely used by organizations' business process help centers to take action on reported customer issues or concerns reported by the organizations' employees themselves [4]. Studies both in theory and application of business process compliance monitoring have been quite common nowadays. This is why a major part of the system's feature, the event progress tracker, will be implemented in this manner even though the whole proposed system is not an incident management systems. Huge part of the system, such as membership and team managements are not treated as incidents or events. In line with this, some of the existing literatures and academic papers that discuss different system used to create, track, and resolve incidents or client requests are discussed below.

Xiao and Wei's [5] development of a project management system for aerial enterprises played an important role in managing the enterprises' huge investments and the long cycle times of its projects. The key feature of the system was to draw dynamic project Gantt chart for the proper management of the enterprises huge projects. The system was implemented using Oracle as its database management system, and PowerBuilder and ASP as its development tools.

The web-based management system designed and implemented by Liping and Hualing for the Dentsu Technology Company highlights the development of its customer interface where clients without account access to the system can submit queries to the enterprise and employee/s can respond to these queries. On this paper, it was found out that a concrete manner of how a customer can reach the company – that is, through direct queries, contributed highly on how the company met the contemporary needs of e-commerce [6]. The system was implemented using ASP technology.

Monitoring systems also had wide applications on the academic field. Xiuli et. al. designed and implemented a Web-based open-Laboratory Management Information System to improve the utilization ratio of laboratory devices, according to the actual requirements of laboratory management [7]. Through system test results,

it was proven that the utilization ratio of the laboratory device anticipated from the laboratory improved since the requests are queued orderly and previously borrowed items were monitored properly. The said system was implemented based on Browser/Server (B/S) architecture and JSP + Servlet + JavaBeans technology.

Another chemical laboratory monitoring information system was designed by Hongzi and Yanrong [8]. According to the study, by implementing the designed system, the experimentation management efficiency will greatly improve, while the use of existing resources will be optimized. Technical implementation wasn't discussed but the design of the system introduced 7 different modules including registration, equipment management, experiment management, chemical management, research management, announcements and system maintenance.

Ouyang and Lu [9] designed the Human Resources Management Information System for universities in China to enhance the utilization of information within the department and to avoid the need of repetitive work. By adopting Computer Supported Cooperative Work (CSCW) technology, the system allows its users to monitor all documents being processed – including all sporadic and disjunctive resources, which lead to the enhancement of cooperation and efficiency of the department.

Yucheng and Yubin [10] designed a server performance monitoring system using B/S mode technology to enable system administrators to view server-side activities by recording monitored data in the database, which can be used during performance testing and network maintenance. Simulation experiment results show that the system proposed is a better program that can provide network or system administrators to understand the overall software performance.

Mazaheri, et. at. [11] conducted a case study on the usability of a hospital's incident reporting system. The study was conducted to increase the hospital's incident reports quantitatively and qualitatively by testing the usability of the current system across a random sample from the Patient Safety department of the hospital. The study also aims to identify the factors of the system that affect the attitude of the users towards reporting incidents. The study shows that the reporting system aids in

organizing patient records and the need of shortcuts to cut time demands while using the system was a recommended.

Yanjun, et. al. [12] introduced the Continuous Emission Monitoring System (CEMS) to play a significant part of the national pollution monitoring network of China. Upon the system's test evaluation, results show that CEMS can be used on monitoring pollutant emissions on real-time which can enable the network to handle such situations. The said system was implemented based on B/S architecture and JSP + Servlet + JavaBeans technology.

It was pointed out that out of the numerous incident monitoring system available up to date, a proper and systematic comparison of the system approaches and implementation does not exist. Therefore, researchers fail to clearly understand which approaches are suitable for a particular setting. With this, Ly, et. al. [13] proposed a framework for Compliance Monitoring Functionalities (CMF) that can resolve the observed problem. The evaluation of existing approaches tested across ten distinct functionalities reveal that none of them are capable of more than seven CMF and most of these tested approaches are not supported by software tools available openly to the public. Although, it was emphasized that some features of the existing approaches were not included in the study, and that only ten primary functionalities were evaluated.

To overall summarize the effectiveness of existing literatures on incident tracking and management, Kim, et. al. [14] developed an instrument to measure critical features that contribute to the effectiveness of incident management systems. The instrument proposed in the study was modelled based on an adaptation of media richness theory, supported with data gathered from interviews with experts on emergency management. The three major components of the instrument include: technologies, processes and external factors involved. Upon design implementation and analysis, the researchers were able to conclude that the designed instrument can allow researchers to assess both strength and weaknesses of existing incident tracking and management systems. These findings can further aid researchers as it inform them on the practice's areas of weakness that needs to be addressed.

### III. THEORETICAL FRAMEWORK

#### A. Shoot UP Manila

Shoot UP Manila (Shoot UPM) started its operation on the first semester of A.Y. 2013 – 2014 established by students of the university who are enthusiasts in the art of photography and videography. The organization mainly aims to hone the talents of those interested in the art, and use it as a tool of service and social relevance to the community [1]. Currently, with its 57 members divided to committees that perform their designated tasks for the organization, Shoot UPM continues to provide service through event documentation inside and outside the university.

Illustrated below is a diagram of Shoot UPM’s organizational structure and an overview of each committee’s tasks.

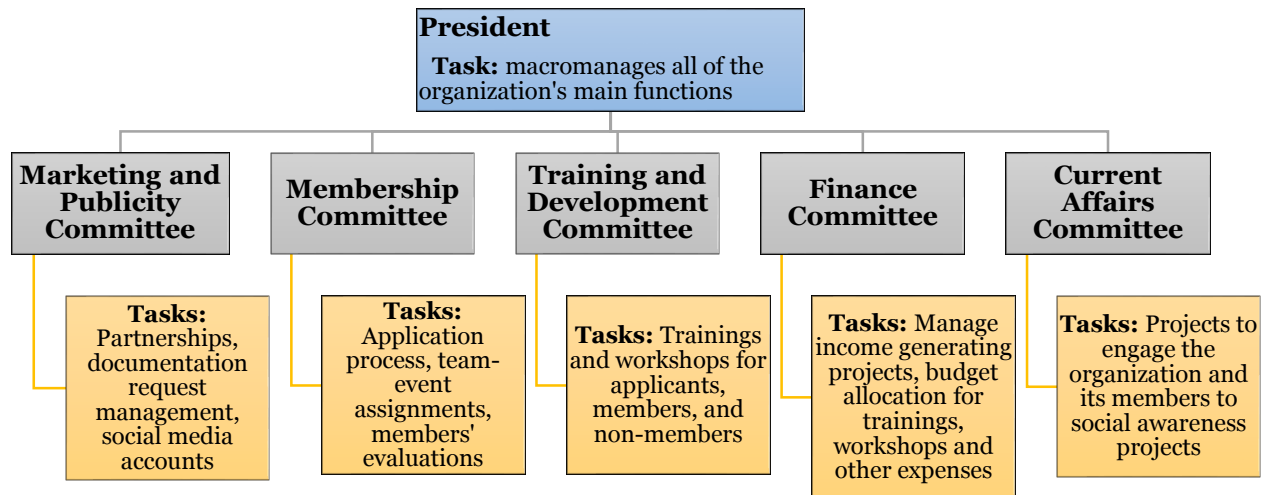

Figure 2: Diagram of Shoot UPM Organizational Structure

#### B. Shoot UPM Member’s Performance Evaluation

Currently, each members are evaluated based on their performance per event that a member covers. As previously mentioned, these evaluations are submitted every after a team covers an event. Results from these evaluations are computed based on a specific set of criteria which includes: punctuality, performance, and commitment. The previous scoring system of the organization involves a starting point which varies

on what type of member are you: Executive committee member gets a starting point of 900, team leaders get 750 and regular members get 650. All members are required to reach a minimum point mark of 1,200 for the whole academic year [3]. This pointing system may be flawed for instances that a member doesn't get to cover a lot of events, either by constraints of academic or personal schedule. With this, the current system suggests a different approach to scoring each members.

Each member evaluation now equates to one "score" on the performance of the member. Each event evaluation scores are averaged to obtain the final and current standing of a member. The scoring scale can be seen on the appendices of the document.

### **C. Incident Management System (IMS)**

Incident Management System, also known as request tracking system, refers to the management of an entire lifecycle of processes linked to the fulfillment of a service request made by a customer to an organization [15]. These types of software keeps track and manages a list of tickets or incidents, each corresponding to a service request submitted by customers. Incident Management Systems are commonly used in customer support call centers of organizations, usually used to create, update, monitor and resolve reported customer concerns [4]. Such systems enable its users to determine who is assigned to manage and resolve a certain ticket, monitor the status of a ticket, view all ticket histories and many more depending on the organization's needs on implementing the system [16].

A significant part of the proposed system, the documentation request management, implements this to properly monitor each and every request submitted to the organization. It is important to note that the proposed system is not solely an incident tracking system. The other half of its proposed features, the membership performance management, are independent from the said framework. This reasons why existing and readily available IMS was not a choice of solution in achieving the objectives of this study.

#### **D. Model-View-Controller (MVC)**

Model-View-Controller (MVC) is a software architectural pattern invented by Trygve Reenskaug. MVC is divided into three interconnected layers to separate internal processing and application of information from the manner it users see and interact with the system [17]. The Model stores, retrieves and manages the data needed by the user. The controller receives user input and commands these actions to either a model, to trigger a function, or to a view, to change the presentation seen by the user. The view is the output presentation seen by the user based on changes the model have [18].

#### **E. PHP: Hypertext Preprocessing**

PHP: Hypertext Preprocessing, or Personal Home Page, is a server-side scripting language mainly used for web development, but can also be used as a general-purpose programming language. It was created by Rasmus Lerdorf in 1994 and now produced by The PHP Group. Codes written in PHP are usually embedded into HTML codes or in combination with various web frameworks available nowadays [19].

#### **F.) Database Management System (DBMS)**

A database management system (DBMS) is a system software used in creating and managing databases. This allows users to create, retrieve, update and manage data in the database. DBMS serves as the interface between the database and the application program to ensure consistent data organization and accessibility. Popular DBMS are classified as follows: Relational DBMS, NoSQL DBMS, In-memory DBMS, Columnar DBMS, and Cloud-based DBMS [20].

#### **G.) Structured Query Language (SQL)**

Structured Query Language or SQL is a special-purpose programming language designed for managing data contained in a relational database management systems. SQL takes form of a command or a query that allows a user to select, insert, update, find data in the database, and many others. There are two types of SQL: data manipulation and data definition languages. The data manipulation language (DML) is syntax of elements that create, change and delete data. The data definition languages are syntax that defines and changes the data structures [21].

## IV. DESIGN AND IMPLEMENTATION

### A. Context Diagram

The system involves four types of users: member, team leader, executive committee member, and client. The context diagram of the system is illustrated below.

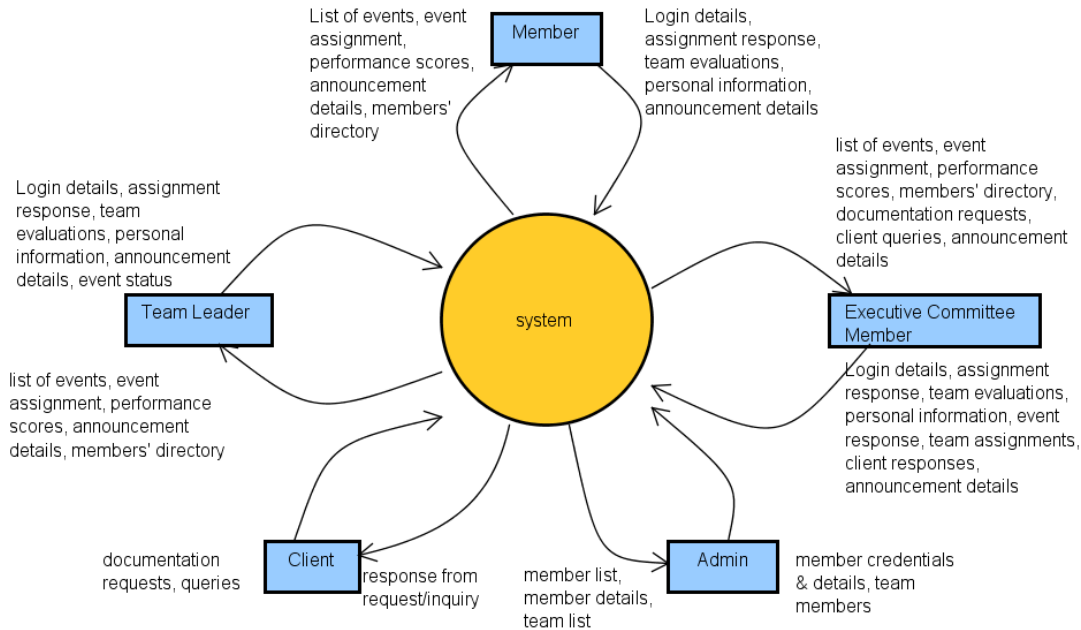

Figure 3: Context Diagram

### B. Use Case Diagram

The following figures will illustrate various functionalities each type of user have. The higher a member is in the hierarchy of the organization, the more his or her functionalities get. The clients get the least amount of functionalities since they aren't entitled to an account to access the system.

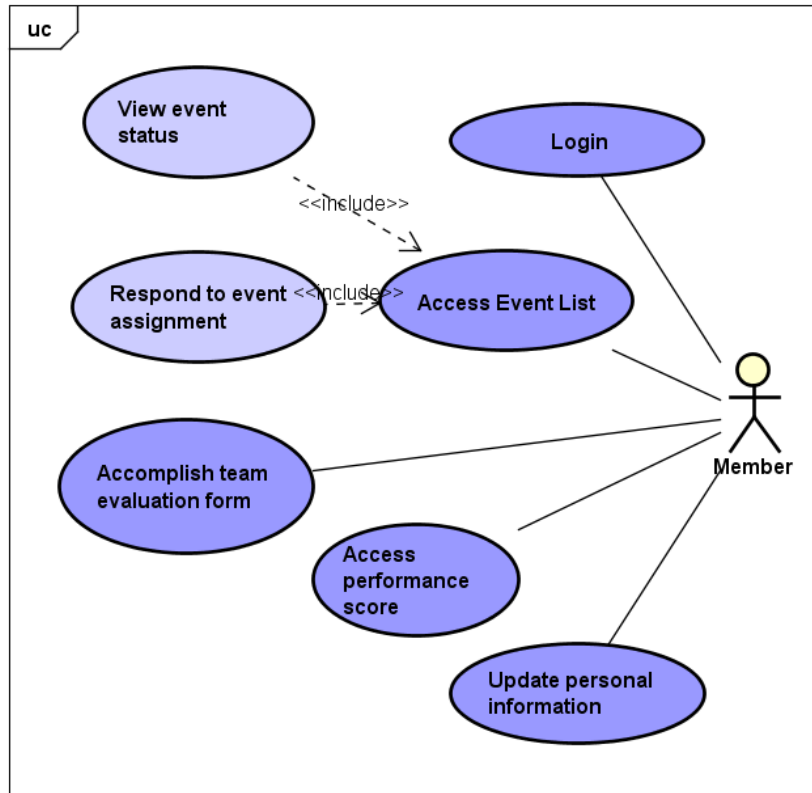

Figure 4: Use Case Diagram, Member functionalities

A regular member of the organization will be given his or her account details to login to the system. He or she can respond to an event assignment as “available” or “not available”, track the status of events that he or she covered, accomplish teammate evaluation sheets, access his or her performance score any time, and update personal information for an updated members’ directory.

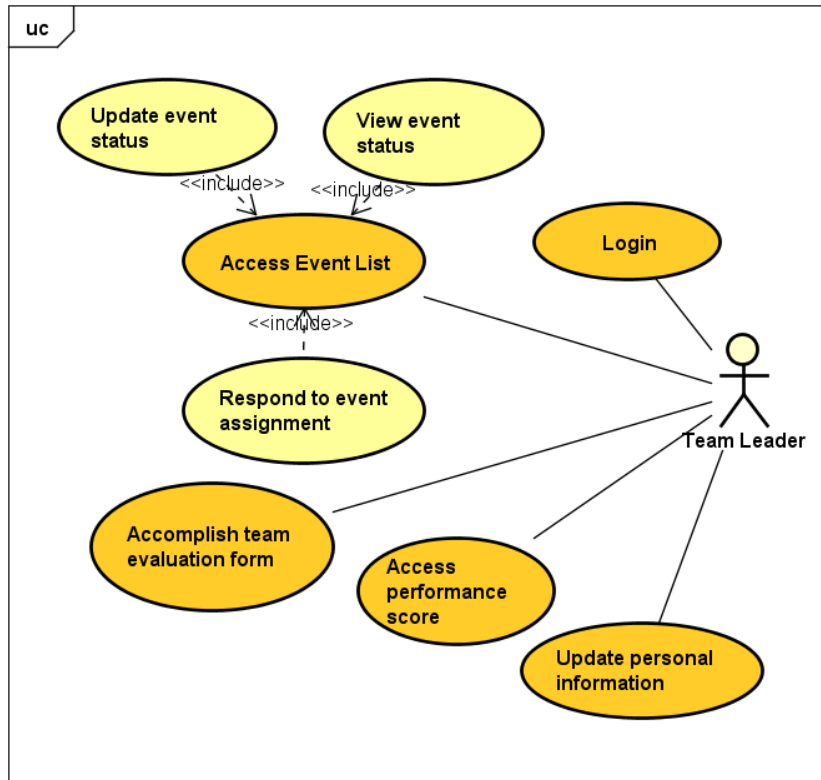

Figure 5: Use Case Diagram, Team Leader functionalities

A team leader will be granted all functionalities that a member has and some other responsibilities in the organization. He or she can also update the status of the event assigned to his or her team. These status changes will serve as an indicator of the progress of the item's post processing activities. A team leader will also receive notifications from events assigned to them which progress points have been stagnant for a certain amount of time. This is to allow them to take specific action needed to finish the processing of the event's deliverables.

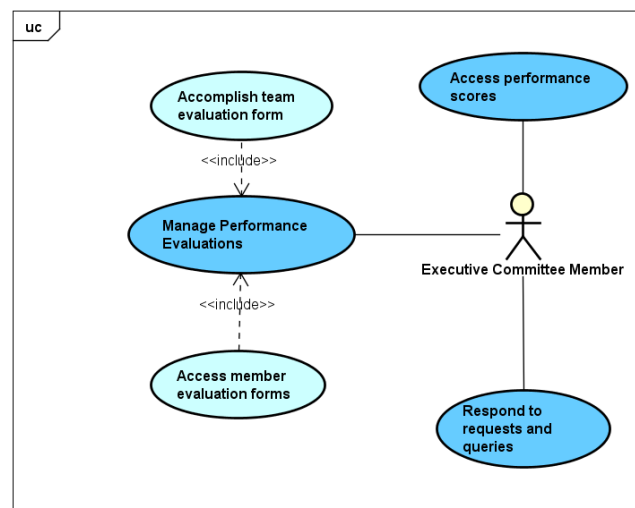

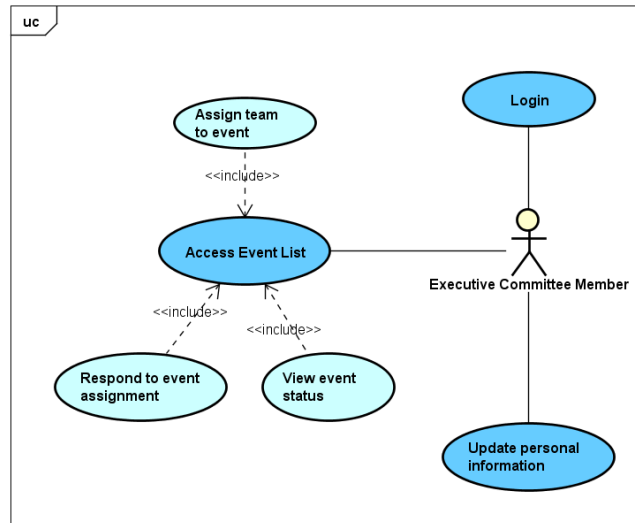

Figure 6: Use Case Diagram, Executive Committee member functionalities

Executive committee members, like team leaders, are given the same basic functionalities a member have. Other than these functionalities, they are also allowed access to documentation requests and queries sent by clients and respond to them accordingly. They can also assign a team to an approved event, and receive notifications from any event which progress points have been stagnant for a certain amount of time. They are also credited to access all members' evaluation forms and record or update the members' score.

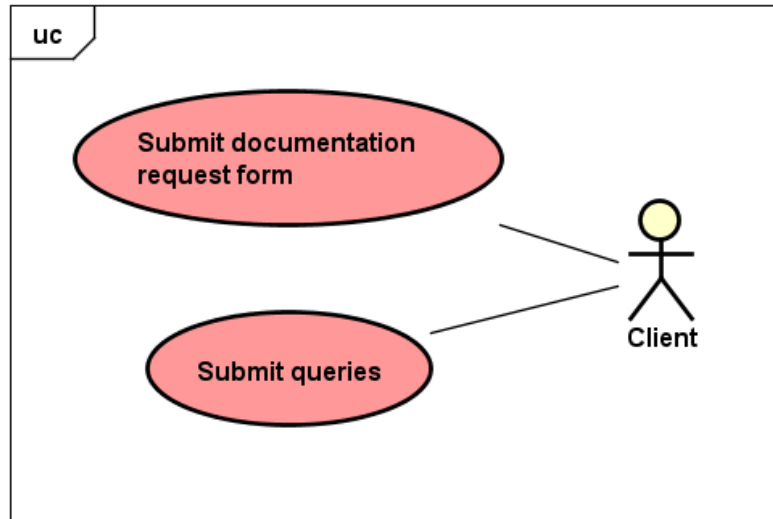

Figure 7: Use Case Diagram, Client functionalities

As non-account holders, clients are only allowed to submit documentation request forms and/or queries directly to the organization using the system.

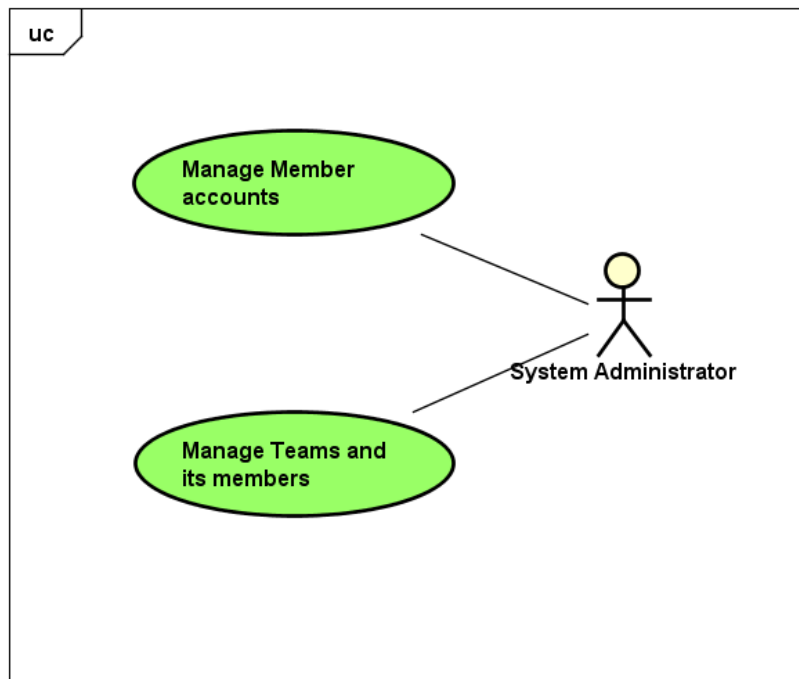

Figure 8: Use Case Diagram, System Administrator functionalities

The system administrator is the one assigned to create accounts for new members, has the ability to update their details, more specifically their roles (as executive committee

member). The system administrator also manage teams by selecting its members and assigning a team leader.

### C. Entity Relationship Diagram

The figure below is the entity relationship diagram of the Shoot UPM Documentation Request and Membership Progress Tracking System.

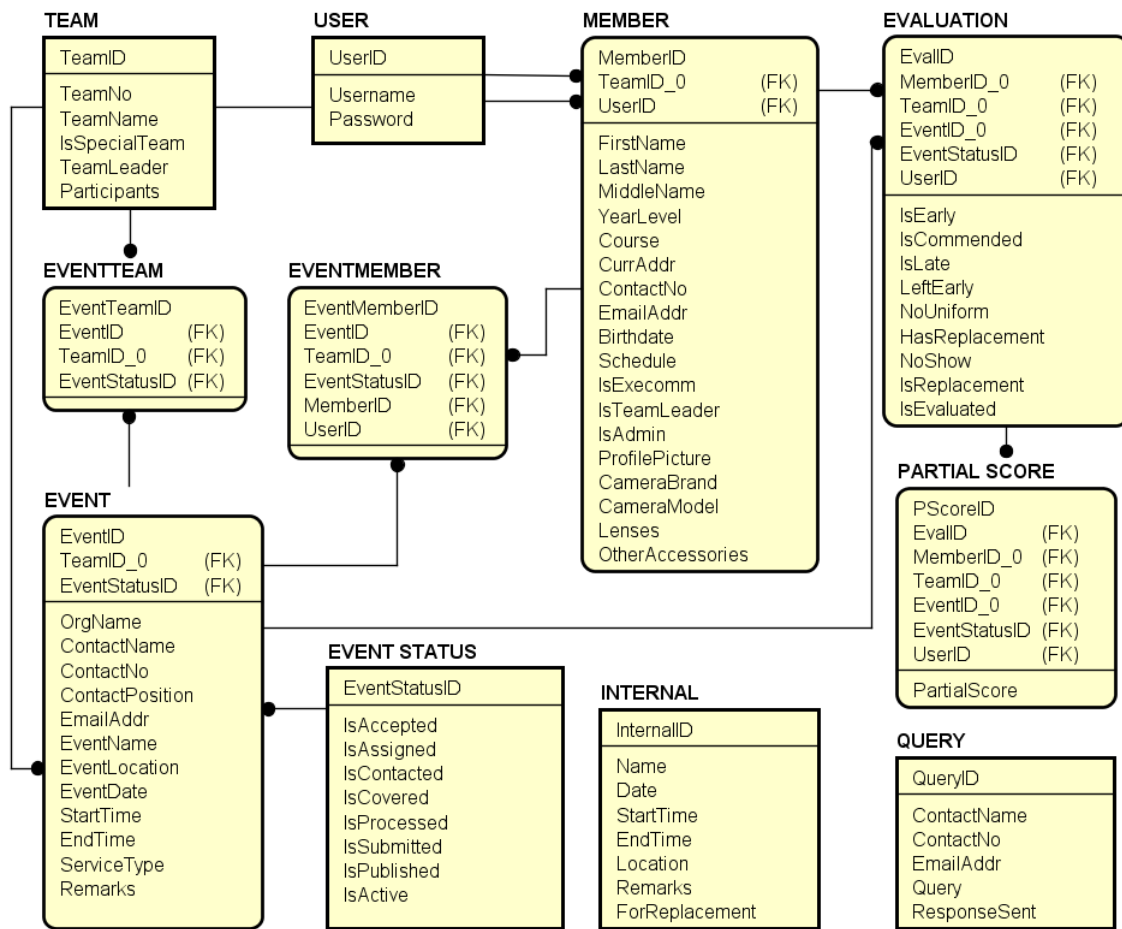

Figure 9: ER Diagram

## D. Data Dictionary

The following tables describe the attributes of each entity from the entity-relationship diagram (ERD) of the Shoot UPM Documentation Request and Membership Progress Tracking System.

Table 1: Team table

<b>Attribute</b>	<b>Data Type</b>	<b>Description</b>
TeamID	int(5)	Unique identifier of a team
TeamName	varchar(30)	Name of the team
TeamLeader	int(11)	Team leader's unique identifier
IsSpecialTeam	bool	Indicator if the team is for a special/specific event/task only
Participants	Varchar(100)	Participants of the team

Table 2: Event table

<b>Attribute</b>	<b>Data Type</b>	<b>Description</b>
EventID	int(5)	Unique identifier of an event
EventStatusID	int(12)	Identifier of the event's status
TeamID	varchar(12)	Identifier of the corresponding team
OrgName	varchar(50)	Name of the organization
ContactName	varchar(50)	Name of the contact person
ContactNo	varchar(11)	Contact number of the contact person
ContactPosition	varchar(50)	Position of the contact person in the organization

EmailAddr	varchar(50)	Email address of the contact person/organization
EventName	varchar(50)	Official name of the event
EventLocation	varchar(50)	Location of the event
EventDate	date	Date of the event
StartTime	time	Time that the event will start
EndTime	time	Time that the event will end
ServiceType	enum('P','S','B')	Type of service: photography or videography or both
Remarks	Varchar(100)	Remarks or notes

Table 3: Event Status table

<b>Attribute</b>	<b>Data Type</b>	<b>Description</b>
EventStatusID	int(5)	Unique identifier of an event status
IsAccepted	bool	If the event was already accepted
IsAssigned	bool	If the event was assigned to a team
IsContacted	bool	If the event organizer was already contacted
IsCovered	bool	If the event was already covered
IsProcessed	bool	If the event deliverables were already pre-processed
IsSubmitted	bool	If the event deliverables were already submitted for posting/to clients
IsPublished	bool	If the event deliverables were already published

IsActive	bool	If the event is still active or not completed
----------	------	---

Table 4: User table

<b>Attribute</b>	<b>Data Type</b>	<b>Description</b>
UserID	int(11)	Unique identifier of a user entry
Username	varchar(100)	Member's username for login
Password	varchar(100)	Member's password for login

Table 5: Member table

<b>Attribute</b>	<b>Data Type</b>	<b>Description</b>
MemberID	int(5)	Unique identifier of a member
UserID	int(11)	Identifier of the member's user credentials
TeamID	int(11)	Identifier of the corresponding team
FirstName	varchar(50)	Member's first name
LastName	varchar(50)	Member's last name
MiddleName	varchar(50)	Member's middle name
YearLevel	enum('1', '2', '3', '4', '5')	Member's year level standing
Course	varchar(30)	Member's course
CurrAddr	varchar(50)	Member's current address
ContactNo	varchar(11)	Member's contact number

EmailAddr	varchar(50)	Member's active email address
Birthday	date	Member's birthdate
Schedule	blob	Member's schedule
ProfilePicture	blob	Member's photo
CameraBrand	varchar(100)	Member's camera brand
CameraModel	varchar(100)	Member's camera model
Lenses	varchar(100)	Member's camera lenses
OtherAccessories	varchar(100)	Member's camera accessories
IsExecomm	bool	Indicator if the member is an executive committee member
IsTeamLeader	bool	Indicator if the member is a team leader
IsAdmin	bool	Indicator if the member is a system administrator

Table 6: Evaluation table

<b>Attribute</b>	<b>Data Type</b>	<b>Description</b>
EvalID	int(11)	Unique identifier of an evaluation
MemberID	int(11)	Identifier of the corresponding member
TeamID	int(11)	Identifier of the corresponding team of the member
EventID	int(11)	Identifier of the corresponding event
IsEarly	bool	If the member was early

IsCommended	bool	If the member was commended by the client
IsLate	bool	If the member was late
LeftEarly	bool	If the member was left the event early
NoUniform	bool	If the member was not wearing proper attire
HasReplacement	bool	If the member was not able to cover, but found a replacement
NoShow	bool	If the member confirmed attendance but did not show during the event
IsReplacement	bool	If the member was a replacement
IsEvaluated	bool	Indicator if the form was already evaluated

Table 7: Partial Score table

<b>Attribute</b>	<b>Data Type</b>	<b>Description</b>
PScoreID	int(11)	Unique identifier of a partial score entry (per evaluation)
EvalID	int(11)	Identifier of the corresponding evaluation
MemberID	int(11)	Identifier of the corresponding member
EventID	int(11)	Identifier of the corresponding event

PartialScore	int(11)	Member's partial score for that event
--------------	---------	---------------------------------------

Table 8: Internal table

<b>Attribute</b>	<b>Data Type</b>	<b>Description</b>
InternalID	int(11)	Unique identifier of an internal concern/announcement
Name	varchar(50)	Name of the announcement
Date	date	Date of the announcement
StartTime	time	Start time of the announcement
EndTime	time	End time of the announcement
Location	varchar(50)	Location of the announcement
Remarks	text	Remarks about the announcement
ForReplacement	Bool	If the announcement is for an event replacement

Table 9: Query table

EventID	int(5)	Unique identifier of specific event
Confirmation	bool	If member can cover or not

## **E. System Architecture**

Shoot UPM Documentation Request and Membership Progress Tracking System will be implemented in PHP using CodeIgniter framework which uses the MVC (Model-View-Control) architecture. The part which will be visible to the users is the system views and HTML, CSS, Javascript, and Bootstrap will be used for the system's interface. The system will interact with the MySQL database using models. The controller will serve as the bridge between the model and the views to communicate.

## **F. Technical Architecture**

Hardware Requirements for the server:

1. PC with 1 GHz processor or higher
2. Up to 2 GB of free disk space
3. 512 GB of RAM or higher

Hardware Requirements for the client:

1. PC with Intel Pentium 4 or later
2. 100 MB of free disk space
3. 128 MB of RAM or higher

## V. RESULTS

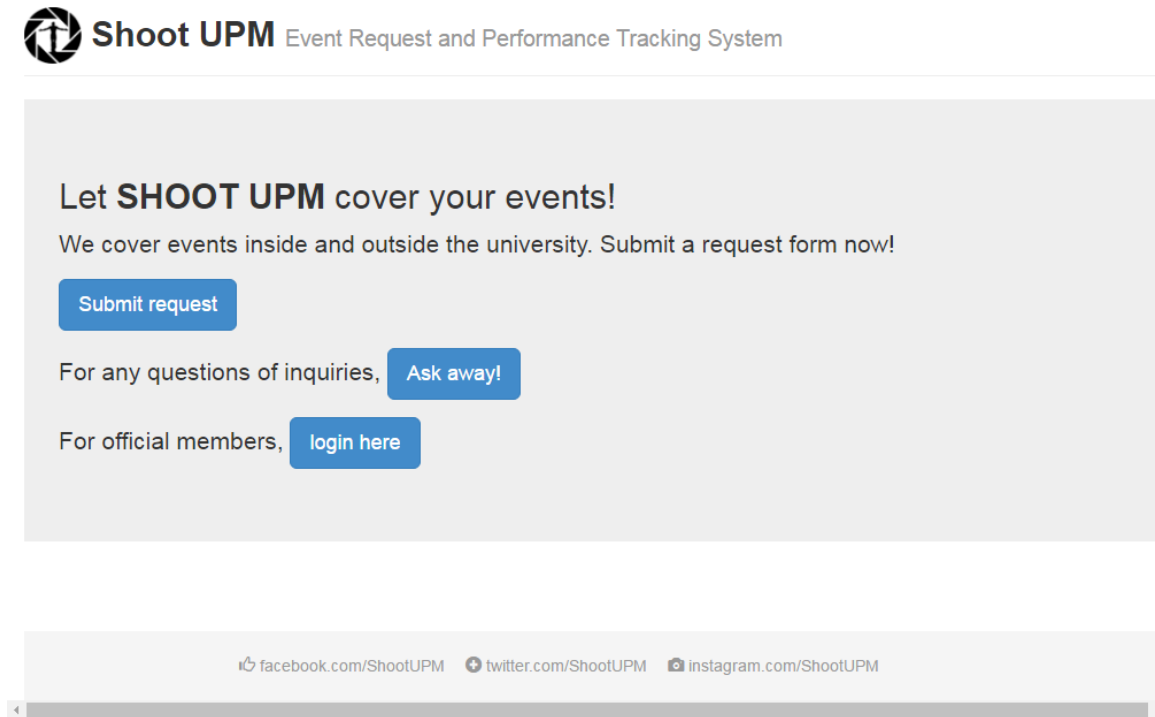

Figure 10: Default home page

This page is accessible to all -- account or non-account owners of the system. Three links are available for access: "Submit request" and "Ask away!" for clients, and "login here" for org members.

## Documentation Guidelines:

1. Form must be given to any member of Shoot UPM two weeks before said event.
2. Shoot UPM owns all photos and videos.
  - a. All photos and videos will have the organization's watermark.
  - b. Shoot UPM will have the freedom to post and use photos from said event in our promotions.
  - c. When the pictures and videos are used, Shoot UPM must be credited.
3. All photos and videos taken during the event will be given to the organization that requested seven working days after the event. If you wish to have the photos and videos saved in a USB/CD, please give the USB/CD to us upon giving the form. The USB/CD will contain original photos and videos with our watermark.

Add Member Cancel

Figure 15: Add Member page

On the menu bar of a system admin, clicking on “Add Member” will direct them to the add member page. The figure above illustrates how a system administrator can add/create a member into the system. The system administrator is to provide a unique and decent username for each member. This is important to note because updating profiles does not allow username changes. The system administrator should also note that the active email address of the member must be used since the member’s login credentials, including his/her password, is contained in an email sent to the organization member.

[Total Events : 5](#)   [Export Excel](#)

Figure 18: Events Directory page

The Events Directory page is the default page for members of the organization who are not system administrators. If the user is an executive committee (execomm) member, he/she can view the statuses the events submitted and processed by the organization, they can also assign teams to each of these events. Execomm members are also entitled to see all events in the directory, unlike regular members who can only see events assigned to their team, and they are not allowed to update event statuses. Team leaders on the other hand are also only limited to seeing events assigned to their teams, but unlike regular members, they can update the status of events on their directory.

The general status of a specific event can easily be identified on the status bar as illustrated above. Red status indicates that event progress is at 0-29% accomplished, yellow indicates 30-50% of the process was accomplished, blue indicates 51-99% of the process is completed. A green bar indicates that an event is fully accomplished. If the event request was rejected by the organization, a full red status bar would appear indicating the inactiveness of the event.

facebook.com/ShootUPM twitter.com/ShootUPM instagram.com/ShootUPM

Figure 26: Announcements page

This page displays all announcements posted for the members. Anyone can post announcements, and edit their own posts in case schedule adjustments are necessary. This also serves as a page where one can post an announcement for looking for replacements in case he/she cannot make it to cover an event. Event replacements announcements are marked with red cameras while regular announcements are marked with a green calendar. This page can be viewed under Shoot UPM -> Announcements tab on the menu bar.

The screenshot shows the 'Announcement Details' form in the Shoot UPM system. At the top, the logo and name 'Shoot UPM Event Request and Performance Tracking System' are displayed. Below this is a navigation bar with links for 'Events', 'Evaluations', 'Queries', and 'Shoot UPM', along with a user profile 'Marquee Mae'. The main form area is titled 'Announcement Details' and includes a checkbox for 'Posting for replacement'. The form fields are: 'Name/Description' (text input), 'Date' (text input with placeholder 'mm/dd/yyyy'), 'Start Time' (text input with placeholder '--:--'), 'End Time' (text input with placeholder '--:--'), 'Location' (text input), and 'Remarks' (text area). At the bottom of the form are two buttons: 'Post Announcement' and 'Cancel'. The footer contains social media links for Facebook, Twitter, and Instagram.

Figure 27: Announcement Form page

An org member will be required to indicate certain details regarding the announcement for the rest of the members to read. It is also important to tick the “posting for replacement” checkbox if a user wishes to look for a replacement on an event he/she cannot cover.

When a user decides logs out of the system, he/she will be redirected back to the login page.

## **VI. DISCUSSION**

The Shoot UPM Event Request and Performance Tracking System is a web-based application system that serves as an organized unifying platform to carry out the main processes that the organization have. It uses different technologies such as PHP frameworks and libraries ensuring that the objectives of the study are achieved.

The system is designed to cater five types of users including: regular member, team leader, executive committee member, system administrator and organization clients. The clients have the least amount of functionalities as they are only to submit documentation requests and/or inquiries regarding their events. The system administrator is tasked to manage user accounts – create new accounts for new members and delete old and inactive accounts. They are also to manage team members and the assignment of a team leader.

Team leaders have a little more functionality than regular members since regular members are only entitled to view/accept events assigned to their team, submit evaluation forms, view replacement posts or announcements, view the team and members' database, track his/her performance score and update personal details. Team leaders, however, can update the status of the events assigned to his/her team accordingly. Other than this, team leaders and regular members almost share the same access levels.

The executive committee members have more functionalities than the previously mentioned users since they are to manage more of the internal processes of the org. These additional functions include responding to documentation requests and inquiries, viewing and regulating the submission of evaluation forms, track the performance scores of all members, assign teams to events and update their statuses as well.

Upon the trial usage of the system, the fact that all general internal processes of the organization in terms of event processing are unified into one single portal – from documentation request submission to evaluation forms submission, eases the

hassle when compared to the current process of the org where it receives requests either via Gmail or Facebook page messages, announces events on Facebook, communicates with other members for internal processes together with the clutter Facebook offers, and accomplishes event evaluations via Google Forms with results exported as excel files. A single working area to view event status and assign processes can aid in the overall performance of the organization when it comes to their service delivery.

The automated performance computations also gives significant ease of use as compared to the current processing of the org where each member must submit a google for containing the answers and will then be calculated manually. These manual computations take time and therefore performance points are not always updated. But with the current implementation, it takes a lot faster for the members to see their evaluation performances.

Technologies involved in developing the system mainly includes the php framework Codeigniter. This framework enabled the developer to create an MVC designed system to perform the study's objectives. Helpers and libraries coupled with the framework made significant contribution to the efficiency of the system.

Bootstrap was used to develop the system's front-end side. It allowed a more user-friendly interface for the various users of the system.

For the development of the database of the system, MySQL was used.

The system also supports the exporting of excel files using an excel builder library. This function may be used for certain directories which may be used for accreditation and recording matters of the organization.

## **VII. CONCLUSION**

The Shoot UPM Event Request and Performance Tracking System, a web-based application, uses various frameworks and libraries necessary to encapsulate all of the organization's major internal processes in an organized manner. The said technology enables the members of the organization to keep all of their event documentation processes well monitored, and have a keener and easier way to evaluate the performance of all of its members.

To be specific, the developed system provides a means for all members to easily see and monitor events that they are involved in, respond easily to requests and take action to their tasks in a much convenient and faster way. In addition to this, members were able to have a means of monitoring their own performance scores as they cover more and more events. This can further aid members to take notes whether or not they are to make extra efforts to maintain a good standing in the organization.

Overall, the system, providing a unified and organized platform to Shoot UPM members, can enable the organization to perform its main objective of documenting events in a more efficient manner, thus reflecting a better image to all of its clients.

## **VIII. RECOMMENDATIONS**

The Shoot UPM Event Request and Performance Tracking System can be further enhanced by adding features such as an SMS notification to clients once email responses are given to their requests and/or inquiries. This SMS feature can also be further used when an event, announcement, or any other concern is notified in the system. This is to improve responsiveness of members' use as they may not always be online to address some of the organization's concerns. For organization purposes, a page that can act as a user's "Inbox" can be added, this is to help a user see all his/her pending work together in a single page.

A feature that indicates what gears are needed or suggested be brought to the event is also suggested. This is to allow teams to plan out the gears, materials and tasks beforehand. Features such as member messaging can also be added to provide for a more interactive and responsive system.

For the member's performance evaluation, it is suggested that the algorithm of the computation be adjusted to allow score adjustments based on the role of each member in the organization. This means that the algorithm of performance score computation will allow extra points for executive committee members, and also for team leaders. This can further be extended by giving incentives to specially awarded members such as "most active", "most punctual", etc.

## X. APPENDIX

### A. Documentation Request Form

### Documentation Request Form

Documentation Guidelines:

1. Form must be given to any member of Shoot UPM two weeks before said event.
2. Shoot UPM owns all photos and videos.
  - a. All photos and videos will have the organization's watermark.
  - b. Shoot UPM will have the freedom to post and use photos from said event in our promotions.
  - c. When the pictures and videos are used, Shoot UPM must be credited.
3. All photos and videos taken during the event will be given to the organization that requested seven working days after the event. If you wish to have the photos and videos saved in a USB/CD, please give the USB/CD to us upon giving the form. The USB/CD will contain original photos and videos with our watermark.

\* Required

#### Organization Profile

Organization Name: \*

Contact's Name: \*

Contact's Mobile Number: \*

Contact's Position: \*

E-Mail Address: \*

## Event Information

Event Name \*

Location of the Event \*

\*For events outside UP Manila, transportation allowance of the team should be provided by the event organizers.

Date and Time of the Event \*

Example: 03/05/2013 11:30 AM

Time of the End of the Event \*

\*Covering team will render service until the indicated time. However should the event still be unfinished on the indicated time, it will be the covering team's decision whether to stay or not.

Example: 11:00 AM

Type of Service Request \*

Other Requests

Please indicate what type of service we could provide for you/ your organization.

Submit

Never submit passwords through Google Forms.

## B. Member Evaluation Form

### Member Points Form

Events points form. Only to be filled by the team leader

\* Required

The logo for SHOOT UP MANILA features a stylized camera shutter icon on the left, composed of several black and white segments. To the right of the icon, the word "SHOOT" is written in a large, bold, sans-serif font, and "UP MANILA" is written in a smaller, all-caps, sans-serif font below it.

Event \*

### Member

Last Name \*

**Minor Plus**

Early bird

**Major Plus**

Commended by client

**Minor Error**

- Late for call time
- Left early

**Error**

- Did not wear required attire
- Cannot cover but informed early (did not find a replacement)
- Did not meet the deadline of returning pictures or video

**Major Error**

- Confirmed but suddenly could not/did not come (no replacement)

**Points of Assessment**

**Assessed by: \***

input your last name

**Password \***

Never submit passwords through Google Forms.

### C. Performance Pointing System

	<b>(-)10</b>	<b>(+)10</b>	<b>(-)50</b>	<b>(+)50</b>	<b>(-)100</b>

    Good day, < ?php echo $Name."!" ?><br /><br />
    This is to inform you that your
documentation request for the event: "<?php
echo $EventName;?>" cannot be covered by
Shoot UPM. :(<br /><br />
    This is because the org is either
already fully booked on the date of your
event, or there are particular details on
your event that does not quite meet with
Shoot UPM's social relevance views.<br />
    In spite of this, we would like to thank
you for choosing our services. We hope you
would still choose Shoot UPM to docum nt
your future events.<br /><br />
    For any questions, feel free to send a
query on our portal. Thank you very
much!<br />
    <b>#ShootOn!</b><br /><br /><br />
    Yours truly, <br /><br />
    SHOOT UPM

## **XI. ACKNOWLEDGEMENT**

As much as I am thankful that I was able to reach this part of my special problem, I would like to keep this page short and sweet.

Thanks to the following for making me reach this far:

- My very supportive parents
- My trusty netbook for not giving up on me
- Caffeine, for */the/* feeling
- My org, Shoot UPM, for a stressful yet fulfilling year that inspired me to push for this topic.
- My block mates, who are though as tired as me, kept on cheering for one another 'til the end.
- My supportive adviser
- S/O for trying so hard
- And dogs – pictures, gifs, vines, videos of dogs -- for keeping me sane when I most wanted to just cry because of the stress.

Hey four-year-ago-self, we made it!
