ABSTRACT

The Clinic for Therapy Services is a project of the University of the Philippines Manila – College of Allied Medical Professions that serves as a venue for rehabilitation service, training, research, and education for its students and faculty. Attending to the therapy needs of the patients are students from CAMP who are enrolled in the clinical training program of their degree. They are monitored and supervised by clinical supervisors, who are licensed therapists and faculty members of the College. The absence of a comprehensive database of patient information for clinic perusal posed a need for this study that designs, develops, and implements a clinical information system to facilitate the storage and retrieval of patient information, scheduling of therapy sessions, generation of census and summary reports, and dissemination of appointment schedule information to patients.

I. INTRODUCTION

Background of the Study

The College of Allied Medical Professions (CAMP) of the University of the Philippines Manila was established in 1962 with the aim of providing leadership in education, research, and services in the fields of Occupational Therapy (OT), Physical Therapy (PT), and Speech Pathology (SP) [1]. In 1991, the concept of the Research and Rehabilitation Development Center was stimulated with the objective of serving as an extension arm of CAMP for the Ermita community through an outpatient clinic for OT, PT, and SP [2].

The Clinic for Therapy Services (CTS, renamed from Clinic for Developmental Therapy Services) started its operations in 1992, and served as the training ground for CAMP students, honing their clinical skills in managing children with developmental delays and their families using the transdisciplinary and interdisciplinary approach as management tools as well as to develop right attitude towards the spirit of service to the Filipino patient and his family [2].

The CTS was then expanded in 2002 resulting to the emergence of the following sections: the Pediatric (Pedia) Section and the Adult & Adolescent (AA) Section. CTS-Pedia offers OT, PT, and SP for infants and children who have been diagnosed with neurodevelopmental, genetic, musculoskeletal, and sensory processing disorders. CTS-AA, on the other hand, aside from giving OT, PT, and SP to patients in adolescence and adulthood, have additional services like fitness classes, money management classes, crafts clinic, job coaching, social participation classes, and community education [3, 4].

Attending to the therapy needs of the patients are students from CAMP who are enrolled in the clinical training program of their degree. They are monitored and supervised by clinical supervisors, who are licensed therapists and faculty members of the College. Since CTS offers its services at very low rates, patient influx to the clinic is relatively high, reaching up to 90 patients a day in each section, most of which are referrals from the Philippine General Hospital and other rehabilitation doctors [5, 6].

Statement of the Problem

While many small- and medium-scale healthcare facilities are rapidly shifting to utilizing electronic medical record systems, CTS still remains left behind working their way through a paper-based medical record system. The records of patients are filed in multilevel steel filing drawers, where search and retrieval of patient information can take a long time because of the massive amount of records kept. However, its healthcare providers still find the ease of data entry and low cost of the said system hard to part with.

At present, a comprehensive database of patient information does not exist for clinic perusal. This poses a problem, particularly in the preparation of accurate and prompt reports. Since information is stored in log books and paper forms, it is difficult to look into each and every one of them when creating census and other types of reports for administrative or research purposes. The lack of an immediate information retrieval mechanism results to inconvenience and waste of time.

Since the clinic was established to serve as a training facility for student interns from CAMP, the cost of therapy sessions are highly affordable, ranging from PhP50 to PhP90. Because of this, the clinic caters to a relatively large population of patients, both for the Pediatric and Adult-Adolescent sections. Still, due to the limited number of timeslots and interns available, not all requests for therapy are immediately accommodated. Some may have to wait for months before they can have their therapy schedules set. A log book for patients on the waiting list is kept and regularly updated by the clinic clerk. Once a slot becomes available, the clerk assigns the schedule for a patient, usually on a first-come, first-served basis, and reminds him/her or his/her caregiver of the appointment through phone call or text messaging. However, due to this long waiting list, some requests are overlooked or skipped.

Since the clinic also serves as a training ground for the student interns, the checking of attendance and payment is left to their management. A log book for daily patient attendance is kept and at the end of a therapy session, the proof of payment is recorded. At the end of the day, the intern-in-charge, with the supervision of the clinic clerk, checks on the log book the number of patients who showed up and counterchecks it against the daily income of the clinic. A better mechanism for this workflow can be addressed by a computerized attendance function.

Objectives

The main objective of the study is to design and implement a clinical information system for the Clinic for Therapy Services of the College of Allied Medical Professions to facilitate the storage and retrieval of patient information, scheduling of therapy sessions, generation of census and summary reports, and dissemination of appointment schedule information to patients.

Specifically, it aims to produce a system with the following functionalities:

- 1) allows the **clinic clerk** to:
 - a. add and update patient records containing personal, demographic, and referral information;
 - b. upload and view scanned documents related to patient care (i.e. indigent letter, doctor's referral, conforme sheet);
 - c. add and update evaluation waitlist entries and appointment schedules
 - d. add and update treatment waitlist entries and appointment schedules
 - e. send SMS reminders to patients and/or their caregivers regarding upcoming appointments;
 - f. update patient attendance records;
 - g. manage patient appointment calendar;
 - h. add record of payment (or waived payment) after every therapy session;
 - i. generate clinic summary reports of patients based on demographics, referral details, medical conditions, etc;
 - j. generate clinic's daily and monthly census and attendance reports;
 - k. generate clinic's daily and monthly income reports; and
 - l. manage archive of records of old and inactive patients
- 2) allows an **intern** to:
 - a. view existing patient records, including personal and medical information;
 - b. input drafts of reports of evaluations conducted;
 - c. input drafts of running notes from therapy sessions conducted;
 - d. input drafts of activity plans for therapy;
 - e. input drafts of home programs to be conducted;

- f. input updated therapy reports based on feedback given by clinical supervisor; and
 - g. view patient appointment calendar
- 3) allows the **clinical supervisor** to:
- a. view existing patient records, including personal and medical information;
 - b. view and input feedback on therapy notes submitted by interns;
 - c. view finalized therapy reports, and generate printable copy of the same, if necessary;
 - d. view patient appointment calendar;
 - e. generate clinic summary reports of patients based on demographics, referral details, medical conditions, etc;
 - f. generate clinic's daily and monthly census and attendance reports;
 - g. generate clinic's daily and monthly income reports; and
 - h. view activity log of users
- 4) allows the **system administrator** to:
- a. manage user accounts; and
 - b. view activity log of users

Significance of the Study

The Clinic for Therapy Services Patient Registry and Schedule Manager facilitates the gradual shift of CTS from operating on a paper-based to an electronic medical record system. As in most clinical information systems, this system provides for an easier, immediate, and efficient storage of large amount of information in a systematic manner and retrieval of the same from a comprehensive database. This ensures that information is readily available to authorized users whenever required. It delivers information with increased accuracy and reliability, especially in terms of report generation, as utmost care is being observed to guarantee that there will be no redundancy or loss of information.

The system also enhances the delivery of healthcare service, as it provides an interface that is easy to understand and operate. It assists the clinicians and personnel in the clinic operations through the computerized calendar and reminder functions. These features trim down the time spent on manual work and maximize efficiency and business performance.

Scope and Limitations

To ensure the security of the system, access is available only to the clinic clerk, interns currently assigned in the clinic and clinical supervisor. The system administrator is ideally one of the aforementioned clinic personnel. An intern may only add therapy notes and reports for clients assigned under his/her care. Likewise, clinical supervisors may only provide feedback to notes and reports assigned under their supervision. Creation of new user accounts is decided upon personal transactions with the system administrator. SMS reminders sent by the system are preformatted, and are verified by the clinic clerk before being sent. Further correspondences regarding appointment schedule are addressed directly to the clerk and not through the system. Format of reports are based on the paper forms currently used by CTS.

II. REVIEW OF RELATED LITERATURE

Rehabilitation therapists — particularly occupational therapists, physical therapists, and speech pathologists — correspond to a growing proportion of health professionals and are becoming central to healthcare delivery. They work in the field of rehabilitation, restoring a person with disability in order to maximize independence in daily life [7]. They work with population of all ages, and in a wide range of physical and psychosocial areas. They may be found practicing in either public or private hospitals, healthcare and rehabilitation centers, nursing homes, or outpatient clinics.

Outpatient rehabilitation is a form of therapy in which patients take a trip to a clinic, hospital or other rehabilitation facility to attend therapy sessions, then leave thereafter, rather than being confined for the duration of the therapy. This type of rehabilitation tends to be less expensive than the latter because there are no costs for hospitalization and associated expenses [8]. Outpatient therapy clinics, like other healthcare facilities, aim to provide the finest healthcare treatment. To ensure that their patients are offered the best service, some of them choose to handle clinic transactions with the aid of clinical information systems [9, 10].

Over the years, rapid technological advancements in services have led to the emergence of new ways to manage healthcare. Evident results of these developments are the improvements made to clinical information systems (CISs) that have enhanced the delivery of healthcare. In a study by Sittig, et al, the presentation of patient-specific information in a legible, organized, and timely manner, a widely used CIS function, helps clinicians in their decision-making process [11]. Physicians often speak about the ease of access to information a big advantage as significant amount of time is saved [12]. The incorporation of an electronic medical records function in a CIS allows healthcare providers to view the relevant information documented over the course of patient care rendered in the particular healthcare facility. An electronic medical record (EMR) should include all information related to a patient, expressed in terminology understood by all record users [13]. Though largely beneficial, EMR-keeping has some disadvantages inherent in the technologies and it requires technical support to maintain and upgrade. As a result, many medical facilities and clinics still maintain paper forms of documentation as either back up or the preferred method for record keeping.

Lack of integration and missing flexibility in content and use are the some of the reasons why some healthcare providers do not see the need to shift to the use of EMR. Other impediments are the inability to adapt to change, the lack of data exchange standards, or the insufficient financial return on investment [14].

An increasing number of studies, nevertheless, continue to emerge, discussing the potential benefits of EMRs. In terms of durability, it has been observed that paper is susceptible to both fire and water. Records are often lost or missing, and backup of paper-based records requires time and resource-intensive effort. On the other hand, electronic records can be stored in various formats such as DVD that are durable and easily duplicated. Security of paper-based records is also limited to locked storage, without the ability to log record access while that of electronic records can be accomplished with data encryption, as well as hardware security keys and passwords. Access to patient records can be tracked and monitored for inappropriate activity [15].

A feasibility study [16] was conducted by Roukema, et al, to evaluate the effectiveness of a general structured data entry (SDE) application for the recording of patient history and physical examination results in the domain of general pediatrics. Initially, they developed OpenSDE to support the structured recording of patient data in any medical domain. From the results of the study, it has been inferred that SDE may be a more suitable form of documentation of objective data than for subjective data. The researchers also mentioned that for EMRs to be accepted in clinical practice, they must meet the demands of their users. For the study though, the participating physicians displayed a positive response towards the use of the application.

A cross-sectional analysis of baseline data was conducted by researchers from the Department of Family Medicine of the UMDNJ-Robert Wood Johnson Medical School in New Jersey, USA. Its purpose was to assess the relationship between EMR usage and diabetes care quality in a sample of family medicine practices. Results showed that diabetes care quality in all practices still have room for improvement, and the use of EMR in primary care practices is insufficient for insuring high-quality diabetes care. Some of the recommendations raised by the researchers were not only to

focus on improving the technology but also on developing methods for integrating and implementing the technology to actual practice [17].

A literature review conducted by Vreeman, et al [18] reported that EMRs have potential important benefits for physical therapists, as they have expanded into more diverse and autonomous practice settings. The studies included in the review noted that an EMR could improve clinical and administrative reporting capabilities, operational efficiency, interdepartmental communication, data accuracy, and the capacity to support clinical research. In 2010, the American Occupational Therapy Association released a report called the Occupational Therapy Practice Framework, which detailed the organization's research on and intentions for an electronic record system, after Kathleen Sebelius, secretary of the Department of Health and Human Services (USA) called for a widespread adoption of electronic medical records throughout the healthcare sector, citing the ways less administrative work can help medical practitioners spend more time with their patients [19].

It has also been expected that handheld electronic medical records will improve physician performance and patient care. To further look into the validity of this hypothesis, a systematic review was made by Wu and Straus in 2006 to assess the effects of this kind of system in clinical practice [20]. Results of the review found improved documentation with the use of handheld computers. Use of handheld devices also reduced medical errors and improved decision support. They considered a qualitative study by McAlearney, Schweikhart, and Medow, which discussed how doctors perceived that handheld devices helped them increase productivity and improve patient care [21]. They used their personal digital assistants for electronic prescribing, coding, point-of-care assistance (i.e. drug information, clinical guidelines, decision aids, patient education), and administrative functions such as tracking schedules. As this study was conducted in 2004, expectations from the participating doctors included that the devices will be more useful in the future when input becomes easier and when organizations offer options for wireless connectivity.

Studies on the improvement of electronic medical records for the use of developing countries have grown in number since the emergence of epidemics and disasters in these places. A special attention is given to these countries as the need for EMRs is most felt in them. In addition, developing

countries are taking huge steps in terms of adoption of information technologies [22]. However, most of them still lack financial and human resources vital for strategic policy making to acquire, train, or accommodate informatics professionals to handle the design and implementation of systems to meet their needs [23]. The impact of EMR on patient care in developing countries can be seen in terms of speedy storage and retrieval of patient records, thus promoting effective and appropriate management of cases leading to quicker recovery without undue hospitalization or repeating diagnostic examinations over and over again. Additionally, access to accurate, correct, and timely information could be a good source of data to plan and prepare for epidemics or disasters to prevent loss of life. More importantly, availability of quality data enhances identification of problems in treatment and finds solutions to prevent extra costs due to ineffective treatment, thus making care delivery less expensive [23]. EMR systems promisingly provide a myriad of benefits to enhance the delivery of healthcare in developing countries [22].

Several studies have also surfaced discussing other functions incorporated in a CIS aside from electronic medical records. Particularly, reviews are being conducted to look into the effects of automatic reminders generated by a CIS in the adherence to scheduled appointments of patients and clinicians alike. The advent of mobile technology has brought about several changes on how information can be transmitted from one person to another. The usability and availability of mobile phones, and the rapid increase in users can be considered as possible aids in the delivery of healthcare, like the use of short message service (SMS) reminders sent to patients of outpatient facilities.

SMS reminders have been used in many fields of medicine. An observational study by Koshy, Car and Majeed [24] saw that SMS messages are very appropriate for use in a healthcare setting because of a number of characteristics including direct patient communication, privacy, confidentiality, swift delivery of messages and receipt of responses, convenience for health providers and patients. SMS messaging technology also reduces labor expenditure as it allows the dispatching of substantial numbers of messages simultaneously. Automated SMS reminders were sent to a group of patients bound for their first ophthalmology consultation, one to four days before the appointment depending on when their bookings were made. The “no-show” rate of the said group was compared to

a control group whose members were patients who weren't sent SMS reminders. Results of the study showed that patients who had received an SMS reminder were significantly more likely to attend their ophthalmology hospital appointments compared to those who had not received an SMS. Still, in the study, it was mentioned that although there seems to be an association between the use of SMS reminders and the decrease in non-attendance rates, it is not necessarily causal and there could be confounding factors and biases which may explain the association.

Other outpatient practices also conducted reviews on the efficacy of the automated SMS reminder system. In Australia, it has been observed that the failure of patients to attend their appointments severely reduces the ability to provide an efficient and effective outpatient service. It wastes clinical and administrative resources, and reduces revenue opportunities [25]. Compared to traditional reminder methods such as telephone calls and posted letters, SMS messaging has less unit costs and requires minimal staff resources to administer. The study took place in a hospital that provides health services to children and adolescents. Similar to [24], the study considered a trial group and a control group and pertinent statistical analysis was made to the data obtained during a three-month study period. The findings provide convincing evidence of the efficacy of SMS text messaging services in improving outpatient appointment attendance rates. Financial impacts of the system were also discussed and it was found to be cost effective, and labor cost was significantly less than traditional means. In summary, the study indicated that SMS text messaging is a very effective technique to improve clinic attendance, access to services and revenue generation in the ambulatory care setting.

Existing technologies like EMRs and SMS messaging are potential solutions to the improvement of healthcare delivery in outpatient medical practice like rehabilitation and therapy clinics. A customized EMR incorporated with automated SMS reminders for patients can be a cost-effective system to implement. With the wide array of information available, such a system can be designed and deployed.

III. CONCEPTUAL FRAMEWORK

Clinic for Therapy Services (CTS)

The Clinic for Therapy Services is a project of the University of the Philippines Manila – College of Allied Medical Professions that serves as a venue for service, training, research, and education for its students and faculty. The clinic started providing rehabilitation services in 1992, initially to children with developmental disabilities and special needs. In 2002, it expanded its program to handle cases of adolescents with developmental disabilities and adults with work-related and neurologic conditions [26].

The CTS was established specifically to provide: training for Occupational Therapy (OT), Physical Therapy (PT), and Speech Pathology (SP) students of the college in effective and efficient evaluation and management of conditions commonly referred to the rehabilitation sciences; rehabilitation services for children, adolescents, and adults that promote the highest level of function and independence in the society; research opportunities to university students, faculty, and other individuals who may wish to conduct scientific studies; and education and training of other healthcare providers and lay people along the lines of other healthcare [26].

Evaluation of new and old returning patients is scheduled daily. A medical referral is required before a patient can be evaluated or treated for OT or PT. SP patients may be treated without a medical referral. Patients for regular treatment are seen on an individual or dyad basis. There are also special classes held in the clinic's Pediatric section designed to develop and improve the skills of the child in stimulated real life situations in which it is necessary for them to learn to interact effectively with others. The clinic interns, under the supervision of their clinical supervisor, also conduct home program sessions depending on the doctor's recommendation, the patient's needs and the family's resources [6].

Shown in figure 1 is the flow of service in CTS for an initial evaluation, the first session to be attended by the patient. It has been slightly reorganized and tailored to fit the technical framework of the proposed system while maintaining most of the processes present in the clinic's current workflow. From the medical referral of a rehabilitation doctor, the therapists design a program for the client

which they will follow through the course of therapy. Priority is given to patients who are not receiving therapy services from other clinics. Generally, once the patient completes a 10-week protocol, the clinical supervisor determines whether there is a need for additional therapy sessions or a transfer of program. An indigent letter verified by a *barangay* or city official may be presented to waive the therapy costs.

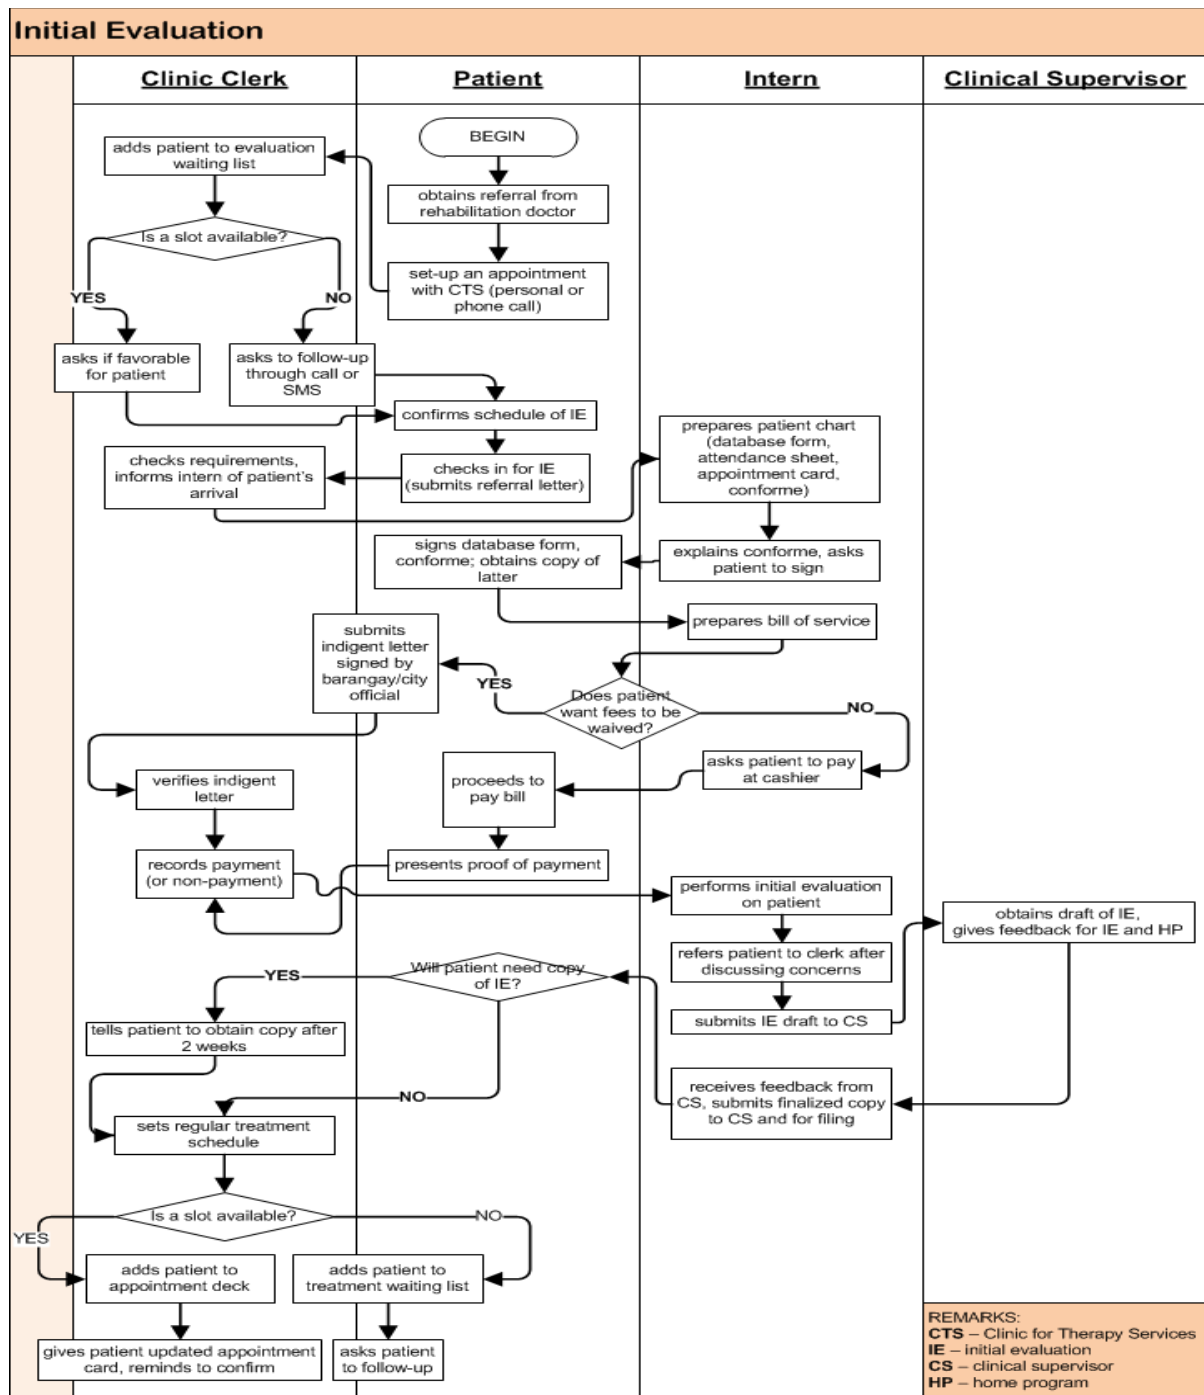

Figure 1. Initial Evaluation workflow

Figure 2 displays the workflow for a regular therapy session. To facilitate the learning of the interns, the clinical supervisor considers a variety of cases for each of them to work on. Patients may be classified as team patients when they receive two or more services at one time. Special arrangements may also be made for mini conferences involving the patient's family and other relevant health professionals. Reminders are given to caregivers to contact the clinic at least a day ahead if they will not be able to make the appointment. The vacated initial evaluation slot will then be occupied by a new patient. Interns assigned to patients are also tasked to remind their patients of their scheduled therapy appointments.

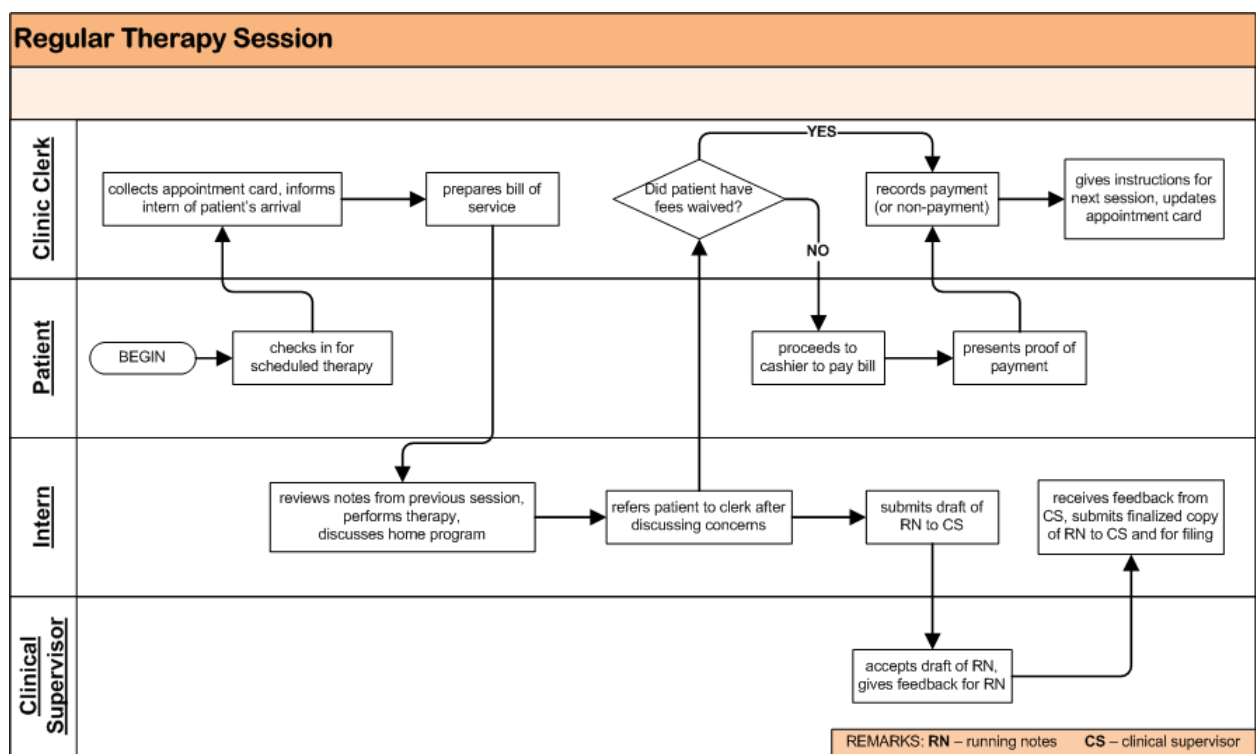

Figure 2. Regular Therapy Session workflow

Clinical Information System (CIS)

A clinical information system is a computer-based technology that is primarily designed for collecting, storing, manipulating, and making available healthcare information essential to the delivery of patient care [27]. The CIS may have one or more of the following tools in it to aid in the provision of medical care: electronic medical records, clinical data repositories, decision support programs (such as clinical guidelines and drug interaction programs), handheld devices for collecting

data and viewing reference materials, imaging modalities, and communication tools such as electronic messaging systems [28].

Benefits of using CIS include easy access to patient data, the availability of a well-organized and structured information repository, and improved patient safety. Despite these evident advantages, however, there are still some barriers, as highlighted by relevant studies, which prevent a CIS from being implemented in a facility. These include the high initial cost of acquisition, privacy and security concerns, lack of certification and standardization, and clinician resistance, among others [27].

Electronic Medical Record (EMR)

According to the Healthcare Information and Management Systems Society, an electronic medical record is a component of an electronic health record (EHR) that is owned by the healthcare provider [29]. It is an application environment composed of the clinical data repository, clinical decision support system, controlled medical vocabulary, computerized provider order entry, pharmacy and clinical documentation applications. The EMR is used by healthcare practitioners to document, monitor, and manage care delivery within a single care delivery organization. The data contained in an EMR belongs to the healthcare facility [30, 31].

The term electronic medical record is used interchangeably with electronic health record. These terms, however, are completely different yet both crucial to the success of improving patient safety, improving the quality and efficiency of patient care, and reducing the costs of healthcare delivery [31]. An EHR is a longitudinal, complete, and unified view of electronic record of patient health information produced by clinical assessments in one or more care settings drawn from across a wide region corresponding to all the providers who are seeing the patient [32].

Studies [33, 34] show that benefits can be obtained from the use of EMR. Among these are financial benefits, which include averted costs and increased revenues for healthcare providers, improved data organization and legibility, and accessibility. While using an EMR can simplify and improve patient care, there are also several challenges associated with it. Some of these are data

management training, the expensive cost of setting up the system, and the resistance of potential users that can be due to the perceived lack of benefits for them [35].

Short Message Service (SMS)

Short Message Service is a mobile data service that allows the transmission of short alphanumeric messages over mobile networks. It is a store-and-forward service where messages sent from a source mobile number are stored in an SMS Center which then forwards it to the destination mobile number [36]. The first SMS was sent in December 1992, from a personal computer to a GSM network. However, it wasn't until the 2000's that SMS took off in popularity [37].

SMS has particularly proved its worth in healthcare. Studies have shown that mobile phones with SMS applications are increasingly used in interventions to deliver healthcare services. It has a number of attributes which makes it particularly suitable for use in healthcare. SMS has been used to enhance efficiency of health service delivery through applications in appointment reminders, improve communication between healthcare workers, and manage queues and temporary human resource needs, among others. It has also been effective in improving diagnosis, treatment and rehabilitation of illnesses through better monitoring mechanisms, remote diagnosis, and provision of psychological support [38].

Gammu

Gammu is library and command line utility for mobile phones released under GNU GPL Version 2. It supports SMS retrieval, backing, and sending, call listing, initiating, and handling, phonebook and calendar tasks, and other basic features of mobile phones [39]. Gammu SMS Daemon, a part of the Gammu family, is a program that periodically scans GSM modem for received messages, stores them in defined storage and also sends messages enqueued in this storage. It is perfect tool for managing big amounts of received or sent messages and automatically processes them. [40]

IV. DESIGN AND IMPLEMENTATION

Context Diagram

The Clinic for Therapy Services Patient Registry and Schedule Manager has four user roles namely clinic clerk, intern, clinical supervisor, and the system administrator. Figure 3 shows the overview of the data flow within the system.

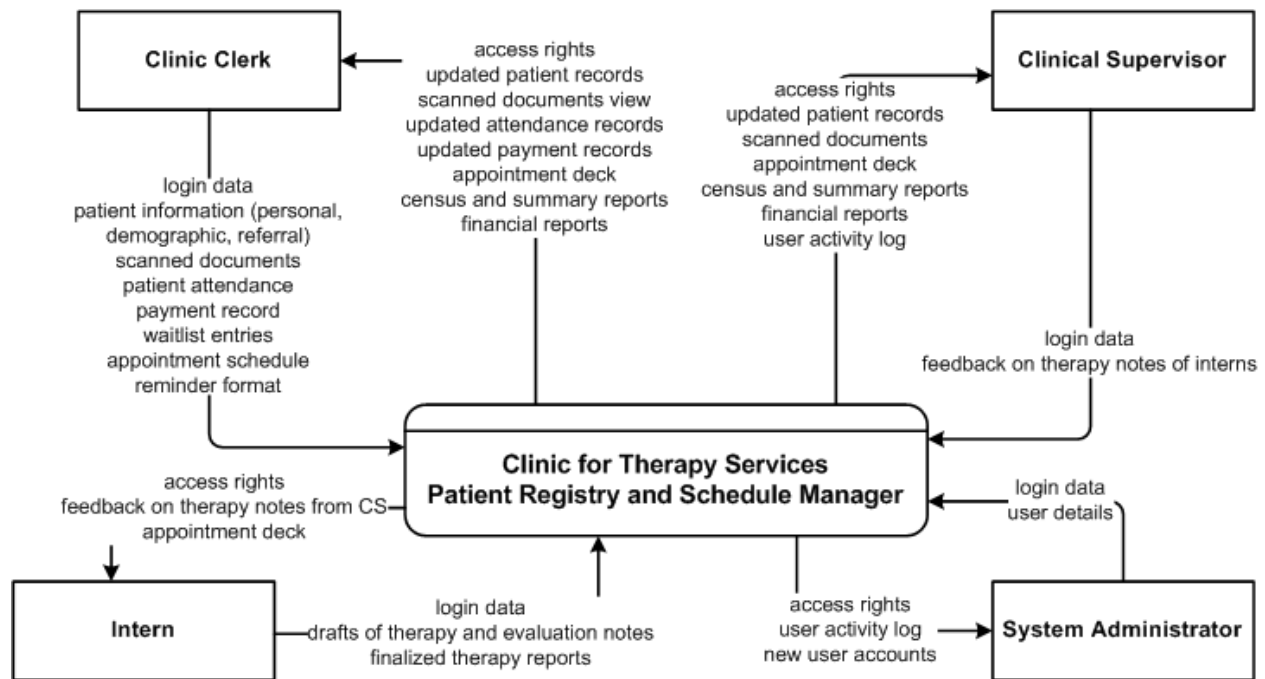

Figure 3. Context Diagram

To gain access to the system, all users have to enter their login data. The different functionalities of the system are available for utilization of the active user upon login.

Data Flow Diagrams

Illustrated on Figure 4 is the top-level data flow diagram for the system. The system has five main processes, with the functionalities of the same nature grouped together. These processes are as follows: System Access Process (1.0), Record Management Process (2.0), Scheduling Process (3.0), Reporting Process (4.0), and System Administration Process (5.0). Subsequently, these main processes are displayed in sub-explosions, highlighting the flow of input data and output information and the sub-processes that take place.

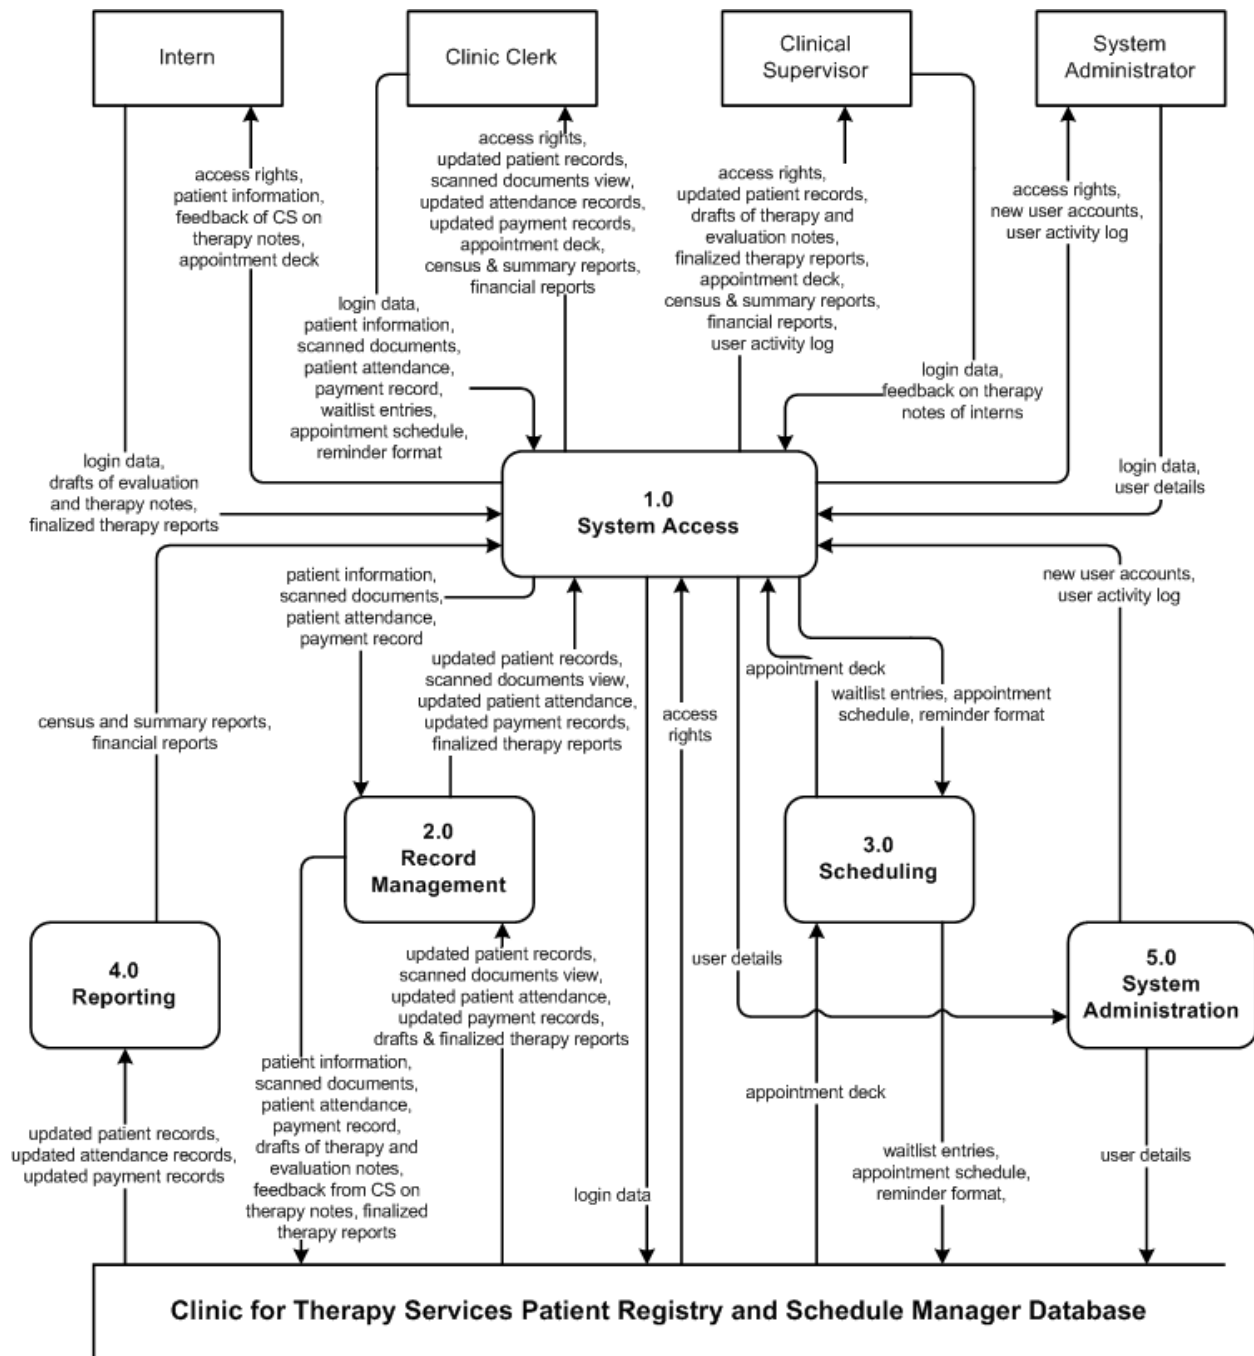

Figure 4. Top-Level Data Flow Diagram

All users, after having their login data verified by the system then receive access rights to the system. The figures thereafter, Figures 5 to 19 depict the data flow and processes available to users in a more specific and in-depth style.

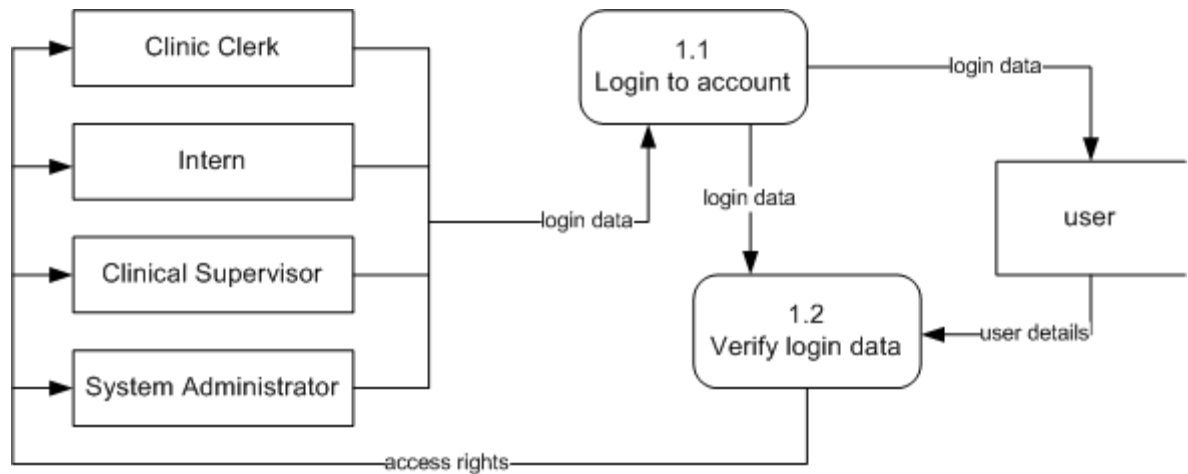

Figure 5. System Access sub-process 1.1 and sub-process 1.2

Patient record management processes include creating, updating, and deactivating patient records which are tasks assigned to the clerk level users.

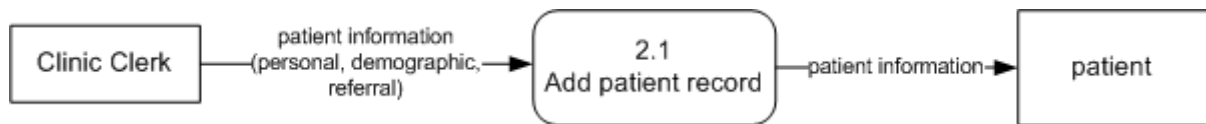

Figure 6. Record Management sub-process 2.1

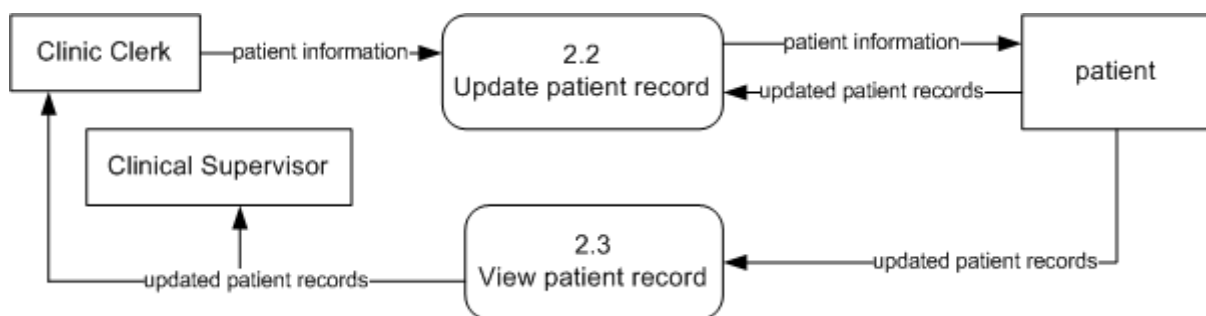

Figure 7. Record Management sub-process 2.2 and sub-process 2.3

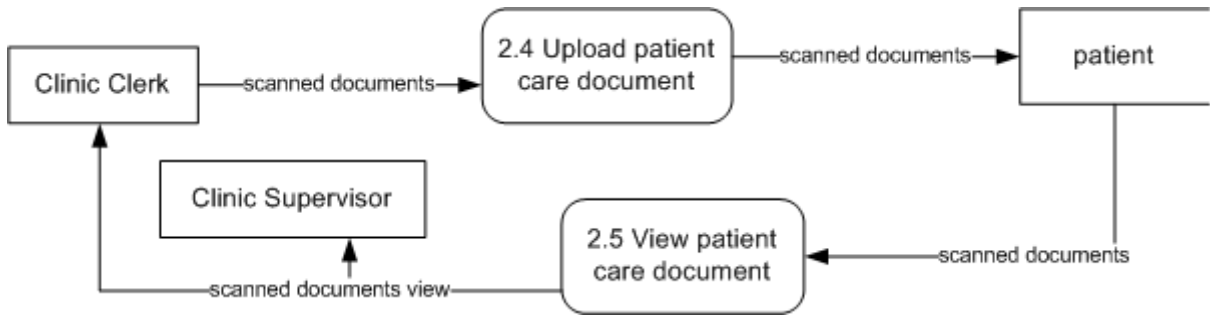

Figure 8. Record Management sub-process 2.4 and sub-process 2.5

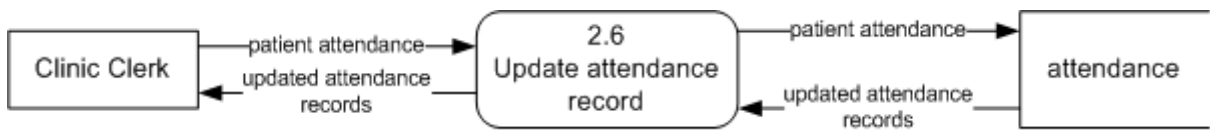

Figure 9. Record Management sub-process 2.6

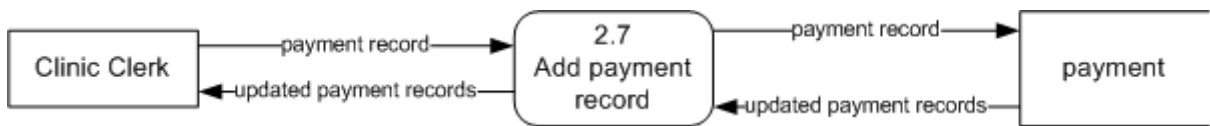

Figure 10. Record Management sub-process 2.7

Record management functionalities for the intern and clinical supervisor level users are limited to adding therapy notes, adding feedback to therapy notes, and viewing the same.

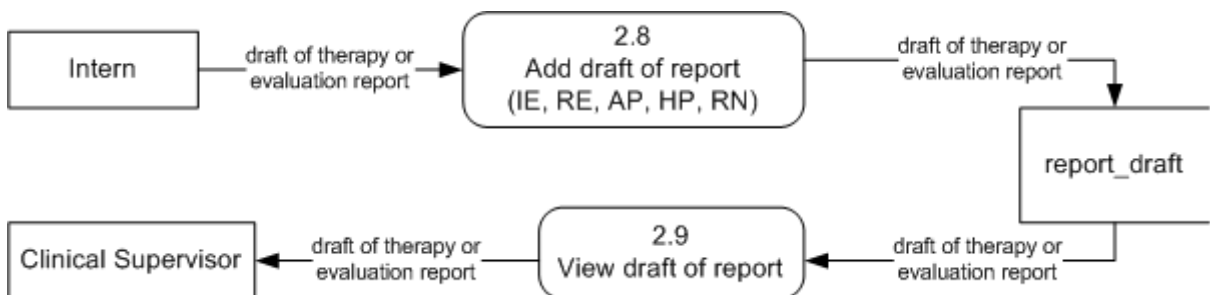

Figure 11. Record Management sub-process 2.8 and sub-process 2.9

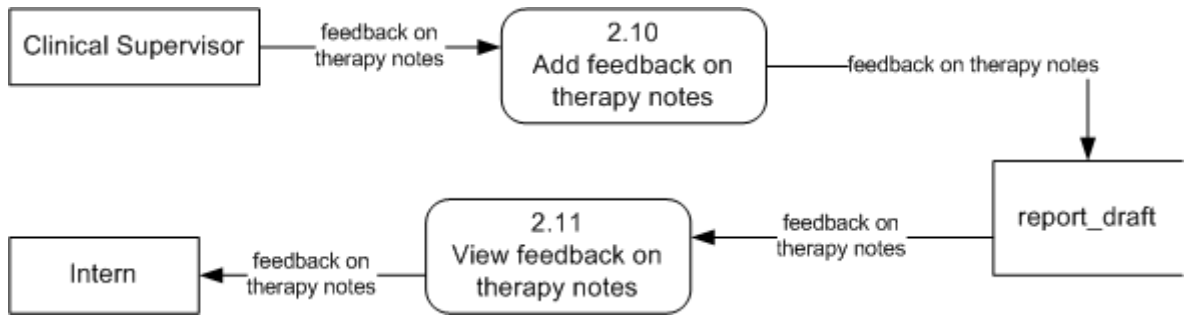

Figure 12. Record Management sub-process 2.10 and sub-process 2.11

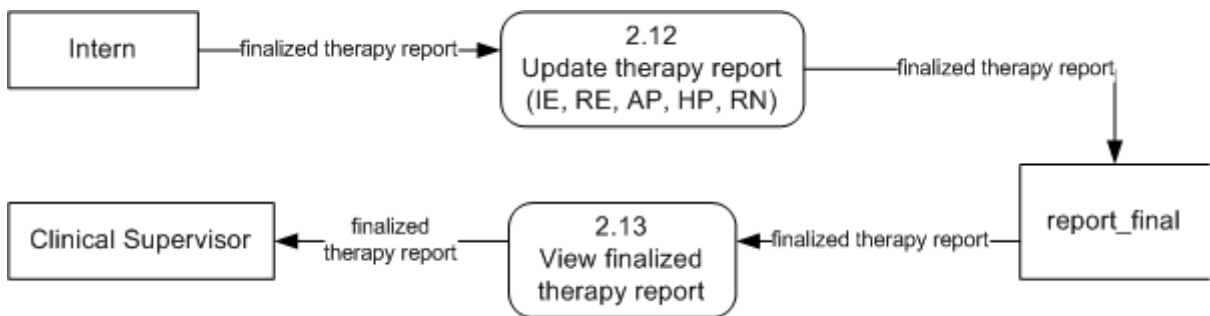

Figure 13. Record Management sub-process 2.12 and sub-process 2.13

The scheduling functionalities, which include adding entries to waitlist, booking time slots for therapy, and managing these therapy schedules, are mainly tasks for clerk level users.

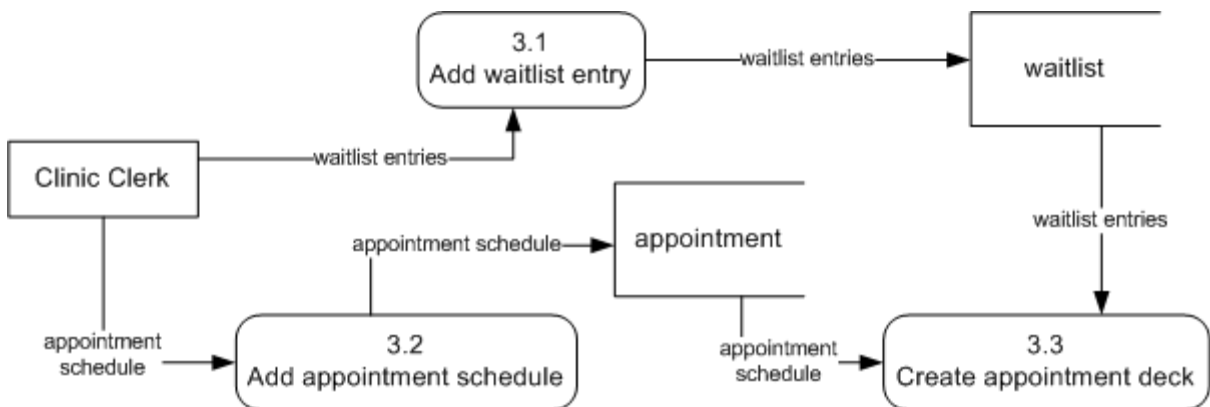

Figure 14. Scheduling sub-process 3.1, sub-process 3.2, and sub-process 3.3

Intern and clinical supervisor level users are limited to viewing the clinic’s calendar or appointment deck.

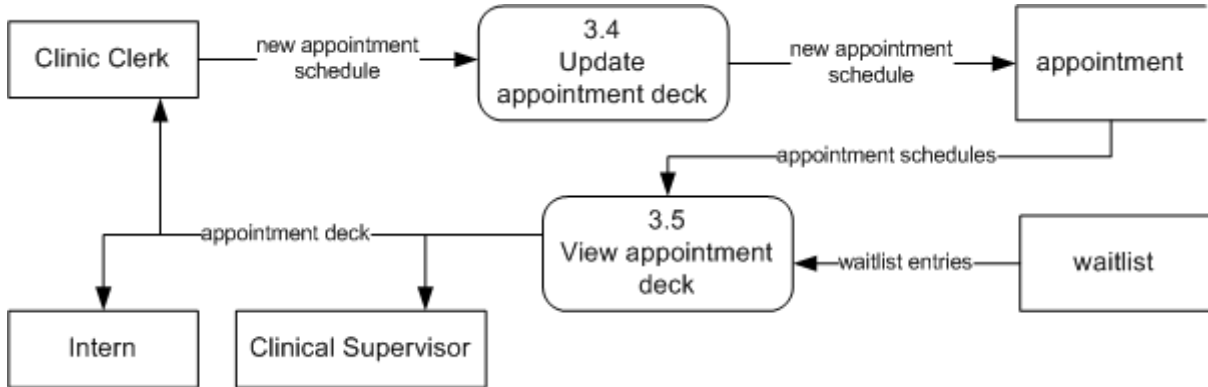

Figure 15. Scheduling sub-process 3.4 and sub-process 3.5

In addition to booking appointments, the clerk also sends SMS reminders to a patient’s or his/her caregiver’s mobile number.

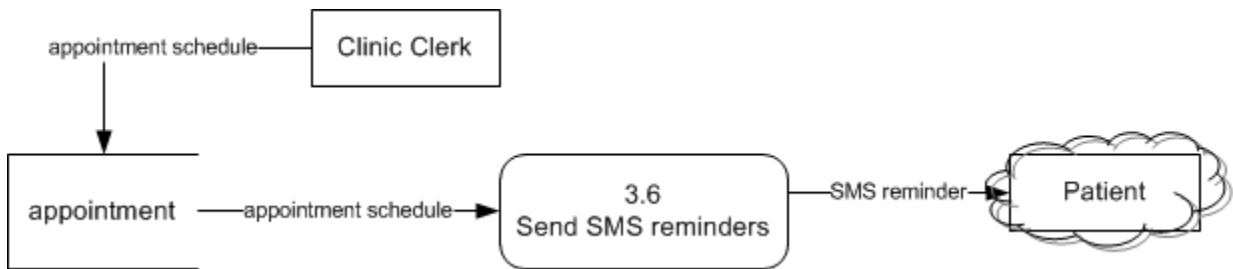

Figure 16. Scheduling sub-process 3.6

The figure above displays a Patient entity surrounded by a cloud. It indicates that while Patient is not a main user role in the system, a functionality of the system has an effect to it.

The reporting sub-processes involves either the clerk or clinical supervisor keying in criteria for their desired reports and the system displaying the results of these, as well as giving the option to generate a printable copy.

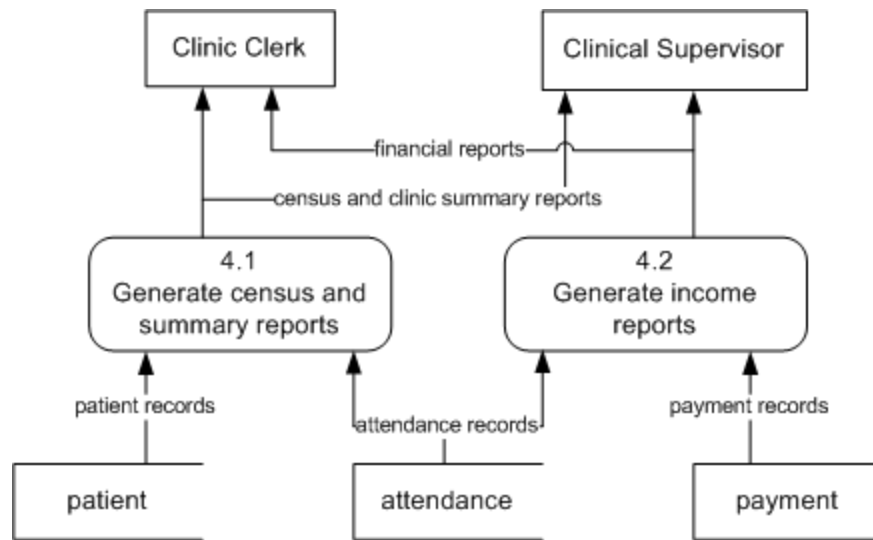

Figure 17. Reporting sub-process 4.1, and sub-process 4.2

System administration functionalities of the system involve creation, updating, deactivation, and reactivation of user accounts. Since the data stored in the system are highly sensitive and confidential, there is no option to sign up for an account through the system. Rather, one must communicate personally with the clinic personnel acting as the system administrator to request for an account.

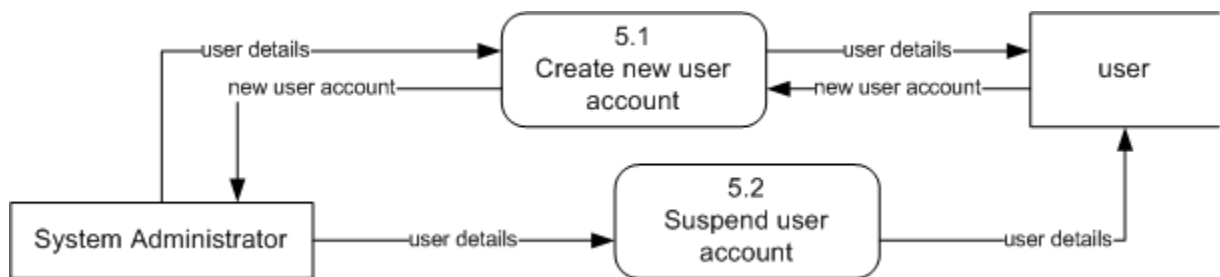

Figure 18. System Administration sub-process 5.1 and sub-process 5.2

The next figure shows the flow of data when a clinical supervisor or the system administrator views the activity log.

Figure 19. System Administration sub-process 5.3

Entity Relationship Diagrams

The succeeding figures display the relationships of the major data entities of the system.

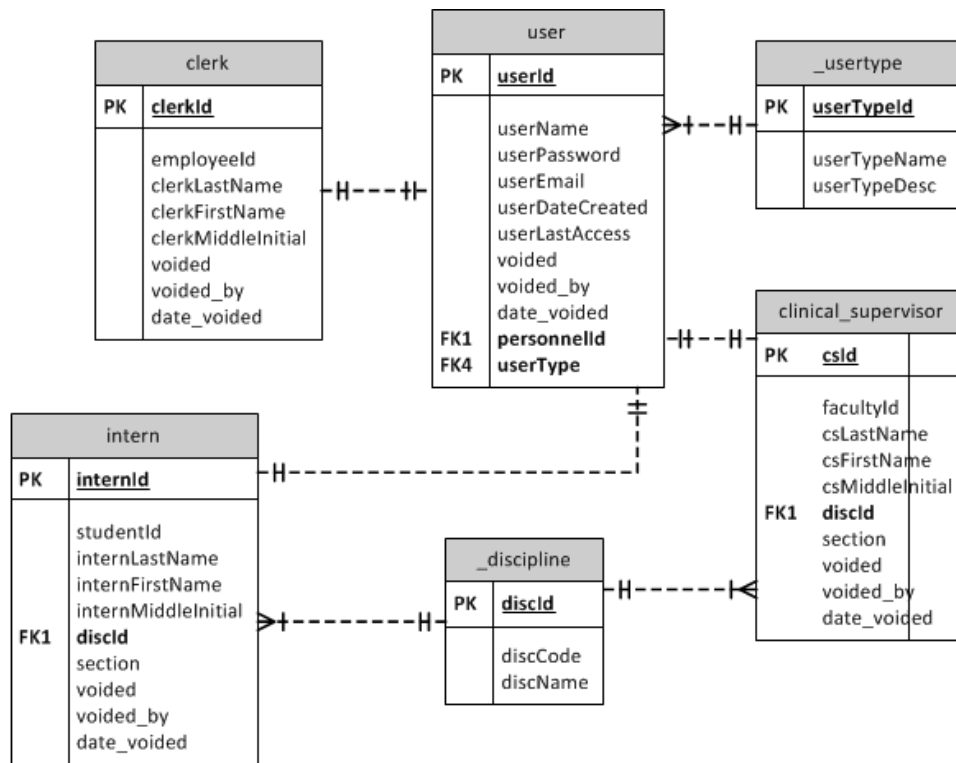

Figure 20. Relationship diagram of user entities

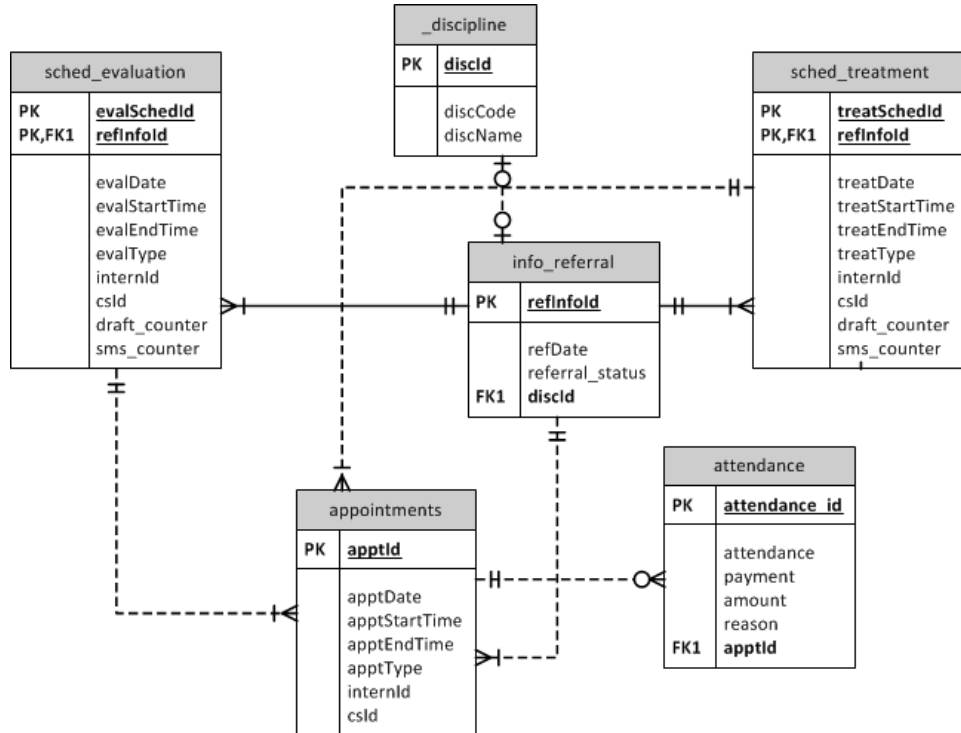

Figure 22. Relationship diagram of schedule entities

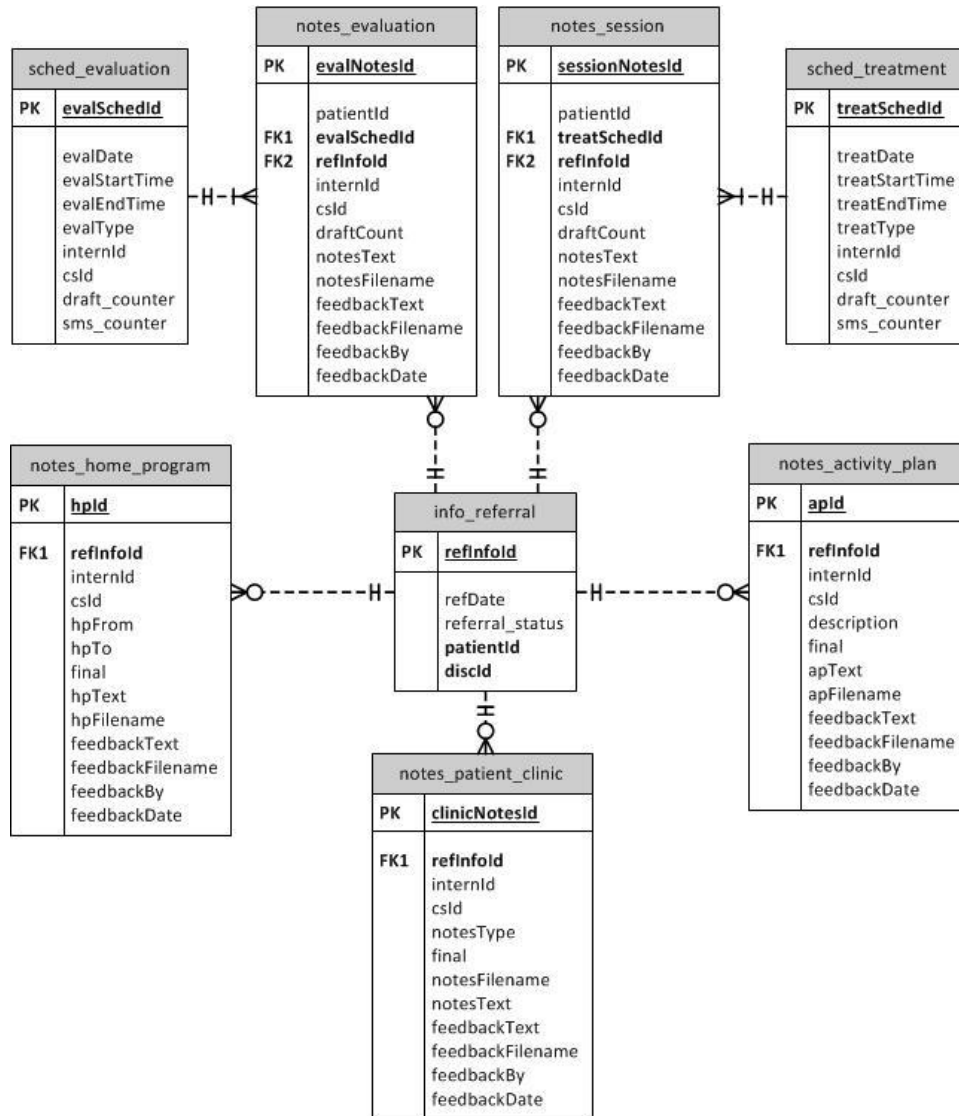

Figure 23. Relationship diagram of therapy report entities

Data Dictionary

The data dictionary contains the data definitions and representations that are created for the CTS Patient Registry and Schedule Manager.

Table 1. **_ancillary_procedure** – lookup table for ancillary procedures

| column | type | attribute/ reference table | Description |
|------------------|-------------|-------------------------------|--|
| ancProcedureId | tinyint(4) | PRIMARY KEY | primary key for table _ancillary_procedure |
| ancProcedureName | varchar(12) | | name of ancillary procedure |
| ancProcedureCode | varchar(5) | | code used for ancillary procedure |

Table 2. **_discipline** – lookup table for discipline

| column | type | attribute/ reference table | Description |
|----------|-------------|----------------------------|------------------------------------|
| discId | tinyint(4) | PRIMARY KEY | primary key for table _discipline |
| discName | varchar(28) | | name of discipline |
| discCode | varchar(3) | | code used for discipline in system |

Table 3. **_new_accounts** – table for new accounts that have yet to be activated

| column | type | attribute/ reference table | Description |
|--------------------|---------------------|----------------------------|-------------------------------------|
| acctId | smallint(6) | PRIMARY KEY | primary key for table _new_accounts |
| acctUsername | varchar(31) | | username |
| acctPassword | varchar(100) | | password |
| acctEmail | varchar(36) | | e-mail address |
| acctIdentification | varchar(11) | | student/faculty/employee number |
| acctFirstName | varchar(50) | | first name of user |
| acctMiddleInitial | varchar(2) | | middle initial of user |
| acctLastName | varchar(50) | | last name of user |
| acctType | tinyint(1) | FOREIGN KEY - _usertype | type of user |
| acctSection | enum('aa', 'pedia') | | section where user is assigned |
| acctDiscipline | tinyint(4) | FOREIGN KEY - _discipline | id of user's discipline |
| acctHash | varchar(100) | | code for account verification |
| date_created | timestamp | | date of creation of record |
| creator | smallint(6) | FOREIGN KEY – user | id creator of record |

Table 4. **_referring_practice** – lookup table for the kinds of referring medical professionals

| column | type | attribute/ reference table | Description |
|-----------------|-------------|----------------------------|---|
| refPracticeId | tinyint(4) | PRIMARY KEY | primary key for table _referring_practice |
| refPracticeName | varchar(24) | | name of practice |
| refPracticeCode | varchar(5) | | code of practice used in system |

Table 5. **_referring_unit_type** – lookup table for the types of clinics where a referral comes from

| column | type | attribute/ reference table | Description |
|-----------------|-------------|----------------------------|---|
| refUnitTypeId | tinyint(4) | PRIMARY KEY | primary key of table _referring_unit_type |
| refUnitTypeName | varchar(24) | | name of type |
| refUnitTypeCode | varchar(8) | | code of type used in system |

Table 6. **_sessions** – lookup table for sessions (table built-in from CodeIgniter)

| column | type | attribute/ reference table | Description |
|---------------|--------------|----------------------------|--------------------------------|
| session_id | varchar(40) | PRIMARY KEY | primary key of table _sessions |
| ip_address | varchar(45) | | IP address of session |
| user_agent | varchar(120) | | |
| last_activity | int(10) | | |
| user_data | text | | |

Table 7. **_usertype** – lookup table for user types

| column | type | attribute/ reference table | Description |
|----------|-------------|----------------------------|--------------------------------|
| userId | tinyint(1) | PRIMARY KEY | primary key of table _usertype |
| userName | varchar(10) | | name of user type |
| userDesc | varchar(20) | | code of type used in system |

Table 8. **activity_log** – table containing activities within the system

| column | type | attribute/ reference table | Description |
|-----------------|--------------|----------------------------|--|
| activity_log_id | int(11) | PRIMARY KEY | primary key of table activity_log |
| date | timestamp | | date of activity |
| username | varchar(12) | | username of user who executed the activity |
| user_type | varchar(10) | | type of user who executed the activity |
| ip_address | varchar(15) | | IP address of user |
| activity | varchar(255) | | activity done by the user |
| page_url | varchar(255) | | source of activity |

Table 9. **admissions** – table containing admission and termination activities in the clinic

| column | type | attribute/ reference table | Description |
|---------------|---|-----------------------------|----------------------------------|
| admissions_id | tinyint(4) | PRIMARY KEY | primary key of table admissions |
| date | date | | date of admission or termination |
| action | enum('admit', 'discharge', 'drop', 'readmit', 'cancel') | | action executed |
| reason | varchar(255) | | reason for termination |
| refInfoId | smallint(6) | FOREIGN KEY - info_referral | id of referral information |
| creator | smallint(6) | FOREIGN KEY - user | id of creator of record |
| date_created | timestamp | | date of creation of record |

Table 10. **appointments** – table containing records of appointments

| column | type | attribute/ reference table | Description |
|---------------|--|-----------------------------------|---------------------------------------|
| apptId | smallint(6) | PRIMARY KEY | primary key for table appointments |
| apptDate | date | | date of appointment |
| apptStartTime | time | | beginning time of appointment |
| apptEndTime | time | | end time of appointment |
| apptType | enum('ie', 're', 'indiv', 'dyad', 'class') | | type of appointment |
| internId | smallint(6) | FOREIGN KEY - intern | id of intern who performs service |
| csId | smallint(6) | FOREIGN KEY - clinical_supervisor | id of clinical supervisor for service |
| refInfoId | smallint(6) | FOREIGN KEY - info_referral | id of referral information |
| schedId | smallint(6) | | id of service from specific table |
| creator | smallint(6) | FOREIGN KEY - user | id of creator of record |
| date_created | timestamp | | date of creation of record |
| changed_by | smallint(6) | FOREIGN KEY - user | id of user to change record |
| date_changed | timestamp | | date of change in record |
| void | tinyint(1) | | status of record (voided or not) |

| | | | |
|-------------|-------------|--------------------|---------------------------|
| voided_by | smallint(6) | FOREIGN KEY - user | id of user to void record |
| date_voided | timestamp | | date of voiding of record |

Table 11. **attendance** – table containing records of attendance to appointments

| column | type | attribute/ reference table | Description |
|----------------|--------------|----------------------------|---------------------------------------|
| attendance_id | smallint(6) | PRIMARY KEY | primary key of table appointments |
| appointment_id | smallint(6) | FOREIGN KEY - appointments | id of appointment |
| attendance | tinyint(1) | | whether patient attended or not |
| payment | varchar(11) | | OR number or letter code, if indigent |
| amount | decimal(5,2) | | amount paid |
| reason | varchar(255) | | reason for absence |
| creator | smallint(6) | FOREIGN KEY - user | id of creator of record |
| date_created | timestamp | | date of creation of record |
| changed_by | smallint(6) | FOREIGN KEY - user | id of user to change record |
| date_changed | timestamp | | date of change in record |

Table 12. **clerk** – table containing clerks' profile information

| column | type | attribute/ reference table | Description |
|--------------------|-------------|----------------------------|----------------------------------|
| clerkId | smallint(6) | PRIMARY KEY | primary key of table clerk |
| employeeId | varchar(11) | | employee id of clerk |
| clerkLastName | varchar(50) | | last name of clerk |
| clerkFirstName | varchar(50) | | first name of clerk |
| clerkMiddleInitial | varchar(1) | | middle initial of clerk |
| voided | tinyint(4) | | status of record (voided or not) |
| voided_by | smallint(6) | | id of user to void record |
| date_voided | timestamp | | date of voiding of record |

Table 13. **clinical_supervisor** – table containing clinic supervisors' profile information

| column | type | attribute/ reference table | Description |
|-----------------|---------------------|----------------------------|--|
| csId | smallint(6) | PRIMARY KEY | primary key for table clinical_information |
| facultyIdNo | varchar(10) | | faculty id number of supervisor |
| csLastName | varchar(50) | | last name of supervisor |
| csFirstName | varchar(50) | | first name of supervisor |
| csMiddleInitial | varchar(1) | | middle initial of supervisor |
| section | enum('aa', 'pedia') | | section where supervisor is assigned |
| discId | tinyint(4) | FOREIGN KEY - _discipline | id of supervisor's discipline |
| voided | tinyint(4) | | status of record (voided or not) |
| voided_by | smallint(6) | | id of user to void record |
| date_voided | timestamp | | date of voiding of record |

Table 14. **daemons** (table built-in from Gammu)

| column | type |
|--------|------|
| Start | text |
| Info | text |

Table 15. **files_medical** – table containing records of medical test results uploaded

| column | type | attribute/ reference table | Description |
|------------------|--------------|------------------------------------|-------------------------------------|
| medFileId | smallint(6) | PRIMARY KEY | primary key for table files_medical |
| patientId | smallint(6) | FOREIGN KEY - patient | id of patient |
| ancProcedureId | tinyint(4) | FOREIGN KEY - _ancillary_procedure | id of ancillary procedure type |
| ancProcedureFile | varchar(255) | | file name |
| voided | tinyint(4) | | status of record (voided or not) |
| voided_by | smallint(6) | FOREIGN KEY - user | id of user to void record |
| date_voided | timestamp | | date of voiding of record |

Table 16. **files_patient** – table containing records of patient files relevant to provision of therapy

| column | type | attribute/ reference table | Description |
|---------------|--------------|----------------------------|------------------------------------|
| patientFileId | int(11) | PRIMARY KEY | primary key of table patient_files |
| patientId | int(11) | | id of patient |
| fileType | varchar(255) | | type of file |
| fileName | varchar(255) | | file name |
| fileRemark | varchar(255) | | remarks on file upload |
| creator | smallint(6) | FOREIGN KEY - user | id of creator of record |
| date_created | timestamp | | date of creation of record |
| changed_by | smallint(6) | FOREIGN KEY - user | id of user to change record |
| date_changed | timestamp | | date of change in record |

Table 17. **files_payment** – table containing records of indigent letters uploaded

| column | type | attribute/ reference table | Description |
|--------------|--------------|----------------------------|--------------------------------------|
| letter_id | smallint(6) | PRIMARY KEY | primary key for table files_payment |
| patient_id | int(11) | FOREIGN KEY - patient | id of patient |
| file_name | varchar(255) | | name of file |
| file_code | varchar(63) | | code for use in attendance |
| valid_from | date | | start of validity of indigent letter |
| valid_to | date | | end of validity of indigent letter |
| creator | smallint(6) | FOREIGN KEY - user | id of creator of record |
| date_created | timestamp | | date of creation of record |
| changed_by | smallint(6) | FOREIGN KEY - user | id of user to change record |
| date_changed | timestamp | | date of change in record |

Table 18. **gammu** – table containing Gammu version (*built-in from Gammu*)

| column | type |
|---------|---------|
| Version | int(11) |

Table 19. **inbox** (*built-in from Gammu*)

| column | type |
|-------------------|--|
| UpdatedInDB | timestamp |
| ReceivingDateTime | timestamp |
| Text | text |
| SenderNumber | varchar(20) |
| Coding | enum('Default_No_Compression', 'Unicode_No_Compression', '8bit', 'Default_Compression', 'Unicode_Compression') |
| UDH | text |

| | |
|-------------|-----------------------|
| SMSCNumber | varchar(20) |
| Class | int(11) |
| TextDecoded | text |
| ID | int(10) |
| RecipientID | text |
| Processed | enum('false', 'true') |

Table 20. **info_contact** – table containing records of contact information

| column | type | attribute/ reference table | Description |
|-----------------|-------------|----------------------------|------------------------------------|
| contactId | smallint(6) | PRIMARY KEY | primary key for table info_contact |
| contactPerson | varchar(75) | | name of contact person |
| contactRelation | varchar(23) | | relationship of person to patient |
| contactLandline | varchar(10) | | landline number |
| contactMobile | varchar(13) | | mobile number |
| contactEmail | varchar(50) | | e-mail address |
| patientId | int(11) | | id of patient |
| voided | tinyint(4) | | status of record (voided or not) |
| voided_by | smallint(6) | FOREIGN KEY - patient | id of user to void record |
| date_voided | timestamp | | date of voiding of record |

Table 21. **info_findings** – table containing records of ancillary procedures with significant findings

| column | type | attribute/ reference table | Description |
|----------------|--------------|---------------------------------------|--|
| findingId | int(11) | PRIMARY KEY | primary key of table info_findings |
| patientId | int(11) | FOREIGN KEY - patient | id of patient |
| ancProcedureId | tinyint(4) | FOREIGN KEY - _ancillary_procedure | id of ancillary procedure |
| findings | varchar(256) | | impressions or findings from procedure |

Table 22. **info_medical** – table containing records of medical diagnosis

| column | type | attribute/ reference table | Description |
|----------------|--------------|----------------------------|--|
| medInfoId | smallint(6) | PRIMARY KEY | primary key of table info_medical |
| medDiagnosis | varchar(255) | | diagnosis of physician |
| medPrecautions | text | | precautionary measures when conducting therapy |
| otDiagnosis | text | | diagnosis of occupational therapist |
| ptDiagnosis | text | | diagnosis of physical therapist |
| spDiagnosis | text | | diagnosis of speech therapist |
| patientId | int(11) | FOREIGN KEY - patient | id of patient |
| voided | tinyint(4) | FOREIGN KEY - user | status of record (voided or not) |
| voided_by | smallint(6) | | id of user to void record |
| date_voided | timestamp | | date of voiding of record |

Table 23. **info_referral** – table containing records of referral information

| column | type | attribute/ reference table | Description |
|-----------------|-------------|----------------------------|------------------------------------|
| refInfoId | smallint(6) | PRIMARY KEY | primary key of table info_referral |
| discId | tinyint(4) | FOREIGN KEY - _discipline | id of discipline |
| refDate | date | | date when patient was referred |
| patientId | int(11) | FOREIGN KEY - patient | id of patient |
| referral_status | varchar(10) | | status of referral |

| | | | |
|--------------|-------------|--------------------|----------------------------------|

| date_voided | | | date of voiding of record |

System Architecture

The system is developed using CodeIgniter, a web application framework written in PHP that uses the model-view-controller architecture. Plugins are added to existing CodeIgniter libraries to provide some features such as CKEditor for the WYSIWYG text editor and DomPDF for PDF creation. Sending of SMS messages is facilitated through the third-party application, Gammu SMS Daemon.

Technical Architecture

The hardware required to run the system depends on the size of the implementation. Preferably, minimum requirements are a server with 2.0 GHz processor (or better), 2 GB of memory (or more) and 150 GB of disk space (or more) with appropriate backup and security facilities. The workstation also needs to have a GSM modem connected to it, like a mobile phone or a USB broadband dongle, connected to the workstation through a data cable or a virtual port.

Configuring the system to work requires an Apache HTTP Server 2.4 (or later), MySQL 5.5 (or later) and a web browser. Another option is to install the latest stable version of XAMPP, in lieu of MySQL 5.5, that comes with phpMyAdmin for database administration. The system also requires Gammu 1.33 to facilitate the sending of SMS reminders to patients.

To access the system as a client, a Javascript-enabled web browser that can read web pages suffices. Additionally, Adobe Acrobat Reader 8.0 (or later) is needed to view the reports generated.

V. RESULTS

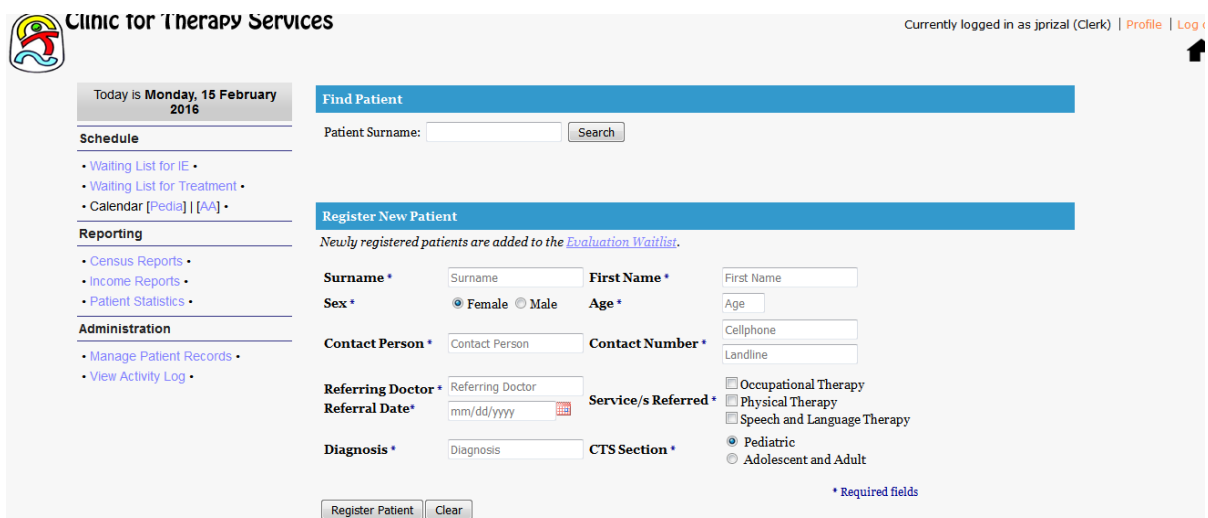

Once a user enters the address of the site, he or she is directed to the login page of the system, as shown on Figure 24.

The login page features two logos at the top: a colorful stylized figure on the left and the official seal of the University of the Philippines Manila College of Allied Medical Professions on the right. Below the logos, the text reads "Clinic For Therapy Services" in a large, bold font, followed by "College of Allied Medical Professions" and "University of the Philippines Manila" in smaller text. The address "Padre Faura St. Ermita, Manila" is listed below. The login section includes a "Username:" label with an input field, a "Password:" label with an input field, and a "Log In" button. Two links are provided below the login fields: "Forgot your password?" and "Did not receive an activation e-mail?".

Figure 24. Login Page

There are four user types within the system: System Administrator, Clerk, Clinical Supervisor, and Intern. Upon logging in, the user is redirected to the homepage which contains the links to functionalities pertinent to their roles in the clinic.

The homepage for Clerks displays the clinic's logo and name "Clinic for Therapy Services" on the left. A navigation menu includes "Schedule", "Reporting", and "Administration" with sub-links. The main content area is divided into three sections: "Find Patient" with a search form for Patient Surname; "Register New Patient" with a form for patient details including Surname, First Name, Sex, Age, Contact Person, Contact Number, Referring Doctor, Referral Date, and Diagnosis; and "Service/s Referred" with checkboxes for Occupational Therapy, Physical Therapy, and Speech and Language Therapy, and radio buttons for Pediatric and Adolescent and Adult. A "Register Patient" button and a "Clear" button are at the bottom. The top right corner shows the user is logged in as "jprizal (Clerk)" with links for "Profile" and "Log out".

Figure 28. Homepage for the System Administrator

For security, users without an account are not able to access the system. An active user is only allowed to change his or her password through the Profile link (see Figure 29). Other changes to the profile are to be coursed through the system administrator.

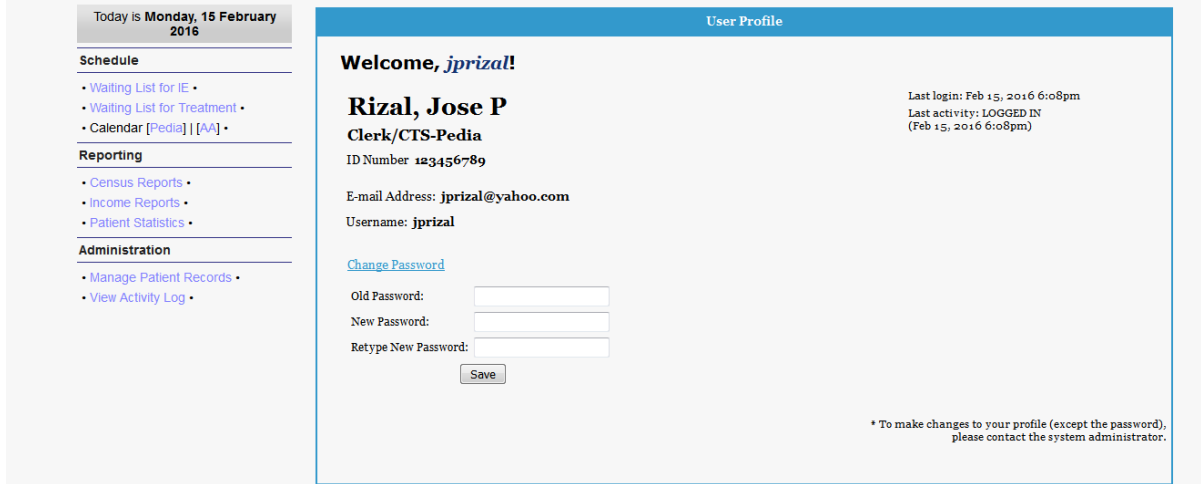

Figure 29. Profile Page

When it is a patient's first time to avail of the clinic's services, the clerk has to create a new record for him or her.

Figure 30. Registering a new patient

On the homepage, a clerk, intern, or clinical supervisor is able to search for a patient's record. Results show the link to the record if the patient has previously availed of the clinic's services.

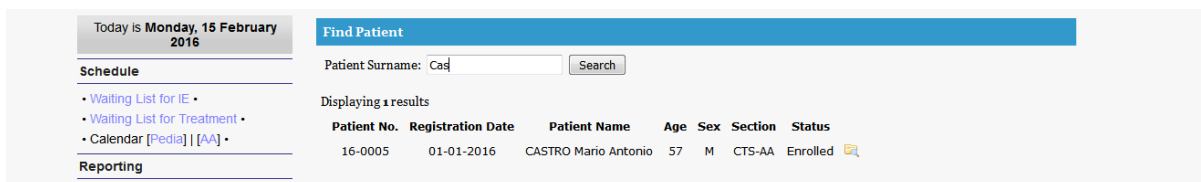

Figure 31. Result of a Record Search

An active record has the patient's personal information along with four tabs that, when clicked, shows the information relevant to the therapy services provided to the patient.

Figure 39. Calendar of Appointments

Only the clerk is given permission to add, update, and delete appointments through updating the waitlist entry or on a specific day in the calendar. The intern and clinical supervisor, on the other hand, can view waitlist entries and appointment schedules afterwards.

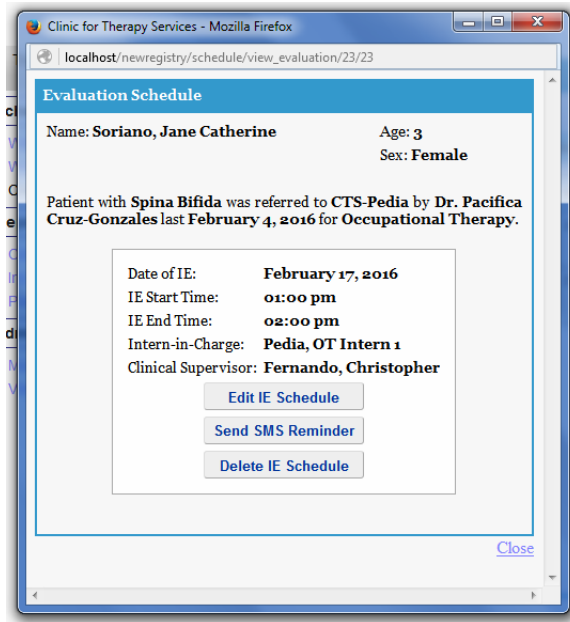

Figure 40. View Evaluation Schedule window

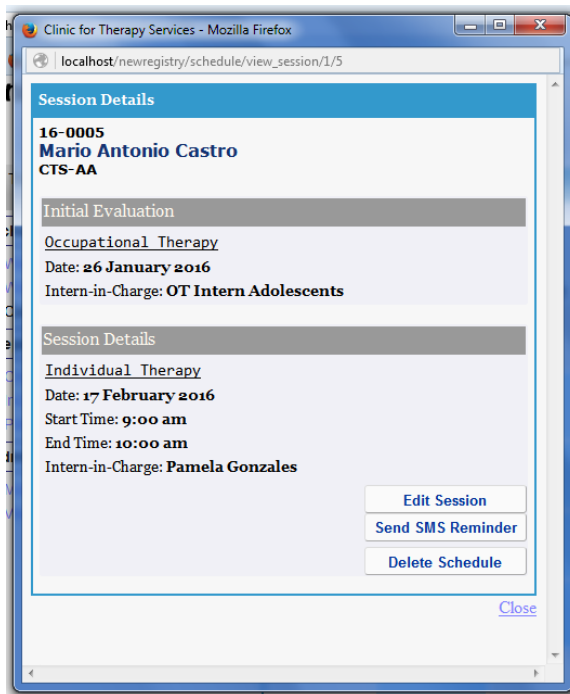

Figure 41. View Session Schedule window

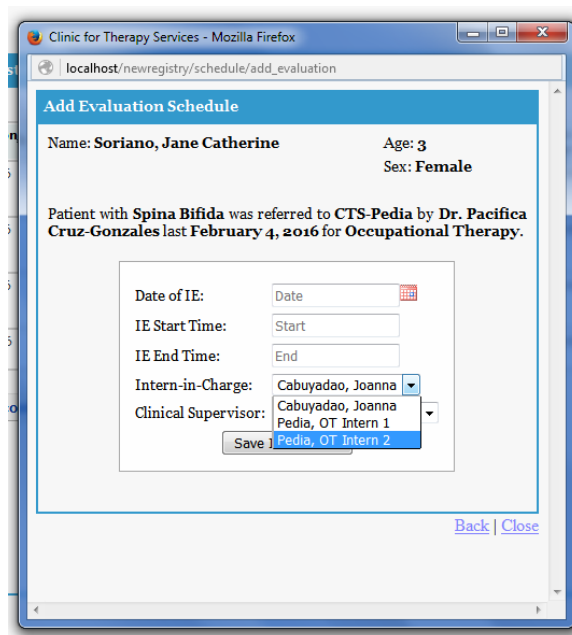

Figure 42. Add Evaluation Schedule window

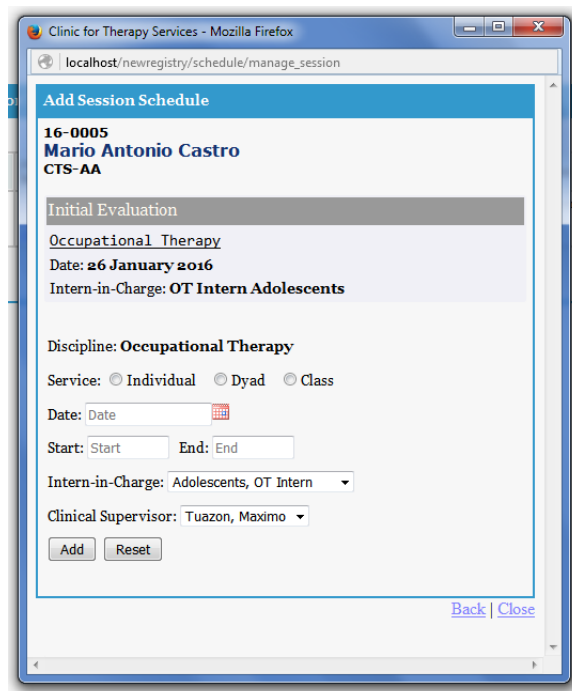

Figure 43. Add Session Schedule window

Additionally, there is also an option for the clerk to send SMS reminders to the contact saved in the patient's record. This is done through the Gammu SMS Daemon that is run within the system.

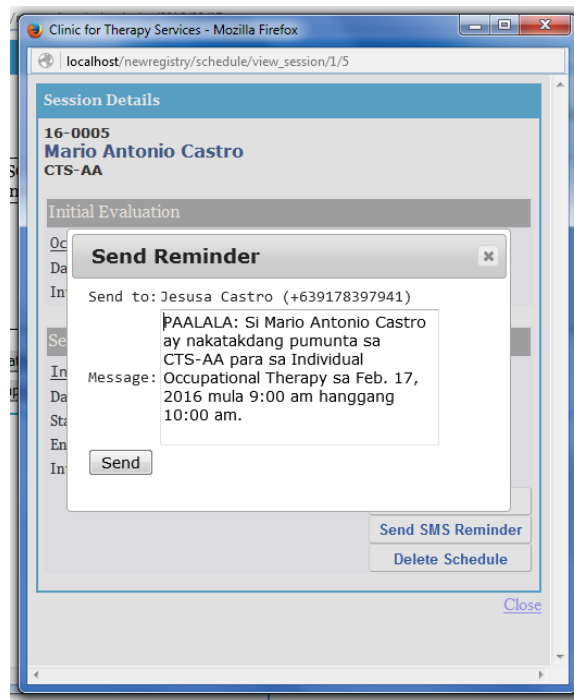

Figure 44. Send SMS Reminder dialog box

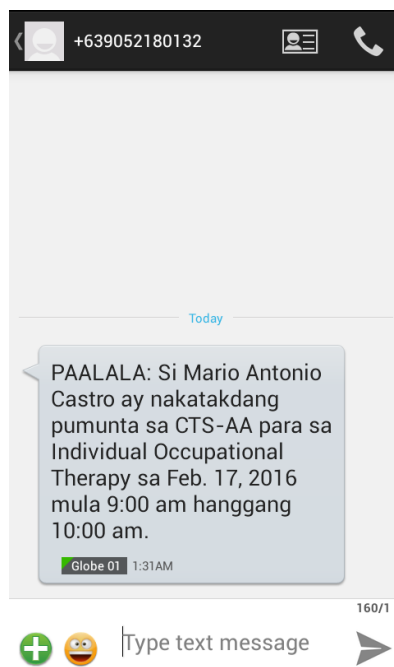

Figure 45. SMS Reminder received by the patient

Appointment schedules of the clinic can be viewed through the calendar. The appointments for the day per intern are displayed on a window when a particular date is clicked.

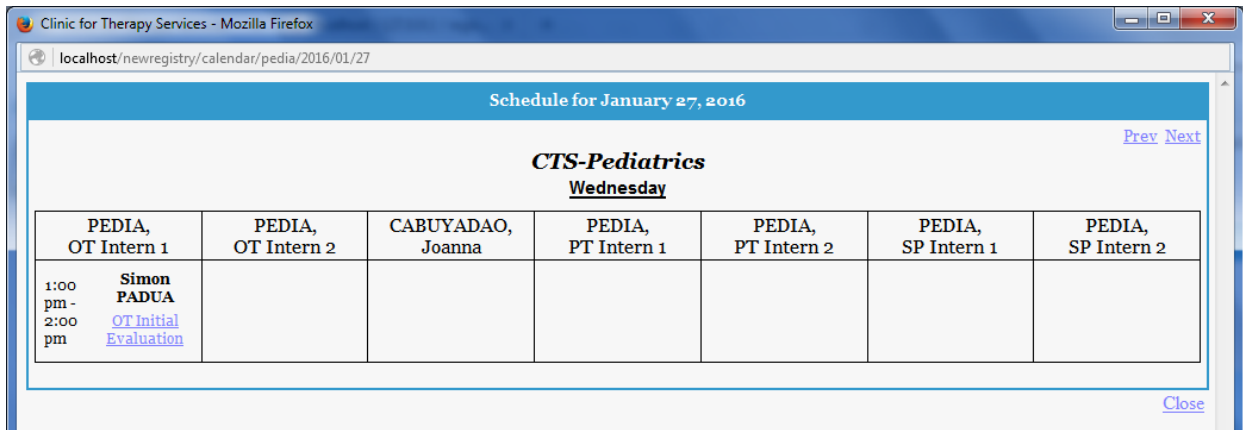

Figure 46. Day View of Appointments

After conducting evaluations and therapy sessions, an intern is able to upload or input drafts of his or her notes to the system. These notes are viewed by the clinical supervisor who provides his or her comments and feedback by entering them on the intern's draft accessed through the system.

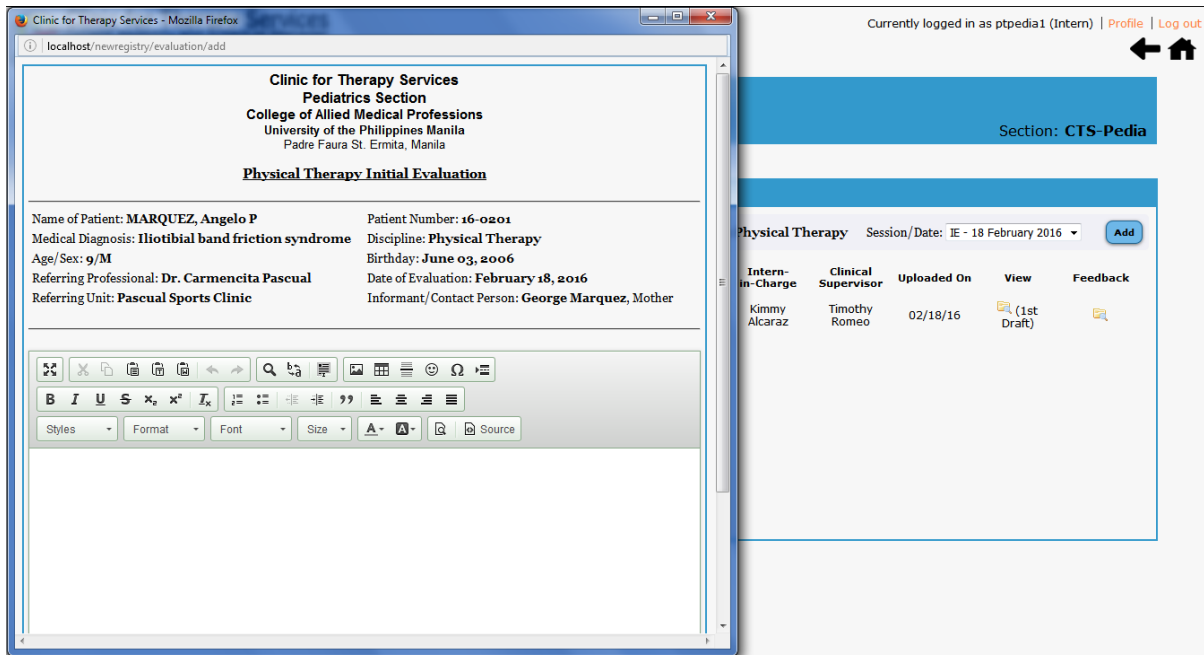

Figure 47. Input Evaluation Report for Interns

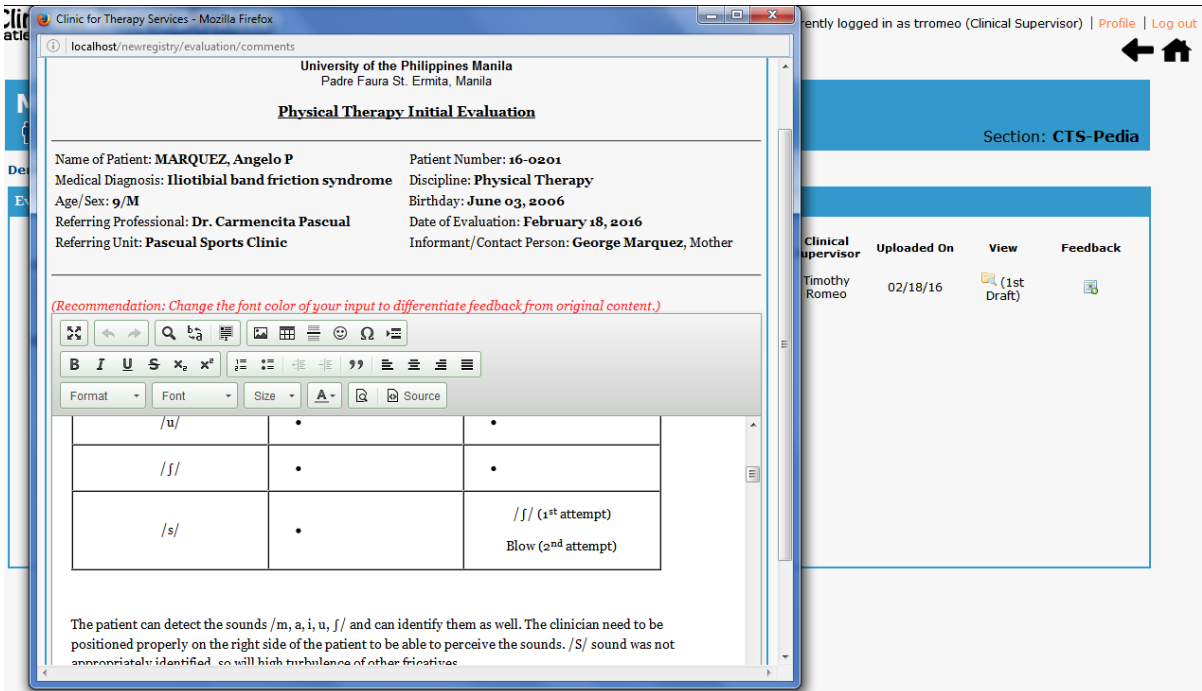

Figure 48. Add Feedback window for Clinical Supervisors

All the files uploaded are saved in the server on specific paths and linked through the patient's record. After each session, the clerk is expected to update the attendance, as well as the payment record of the patient. This can be done through a link on the Attendance tab.

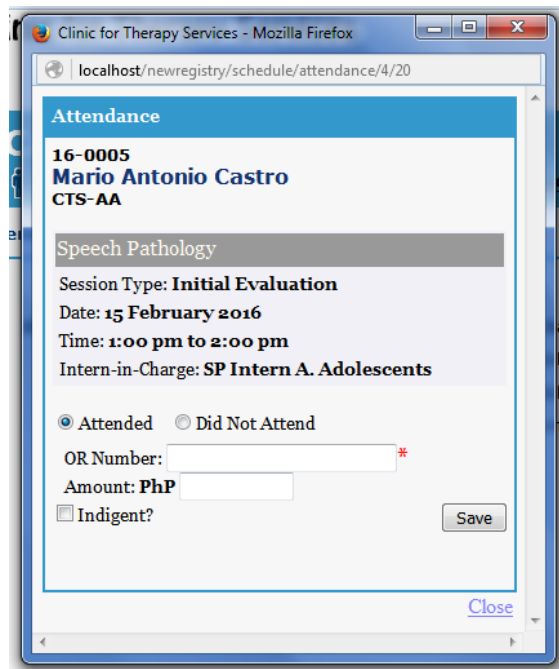

Figure 49. Set Attendance window

Fees may be waived for indigent patients provided they can show a certification which will also be saved in the system.

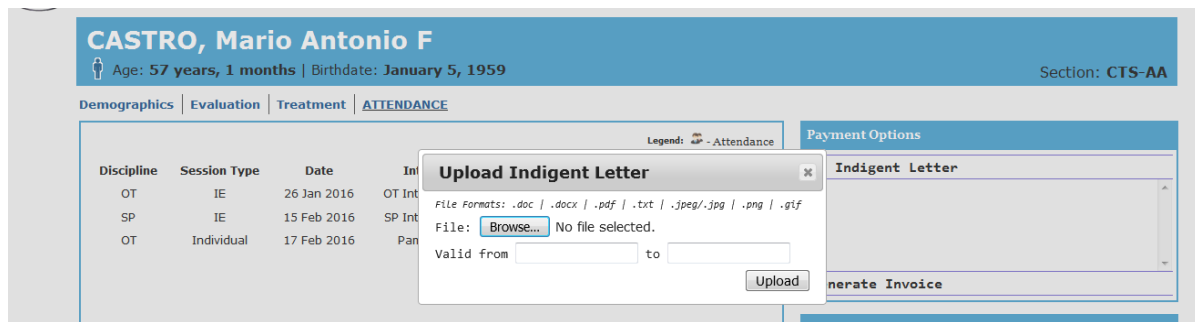

Figure 50. Upload Indigent Letter dialog box

The clerk or clinical supervisor can easily create summary and income reports through the reporting functionalities of the system by keying in the criteria needed.

Figure 53. Printable Census Report

The clerk has the authorization to discharge or drop patients from services and deactivate their records. Inactive records are displayed through a link on the navigation bar and may be reactivated in case these patients return to the clinic after being discharged or dropped.

The screenshot shows the 'Manage Patient Records' section of a web application. At the top left is the 'es ager' logo. At the top right, it says 'Currently logged in as pegasmen56 (Clerk) | Profile | Log out' with navigation icons for back and home. Below this is a blue header for 'Manage Patient Records'. A table lists patient records with columns: Patient Number, Name, Age, Sex, Contact Number, Section, Date Registered, Medical Condition, Referring Physician, and Activate. One record is shown for Santos, William, age 27, male, contact +639176275086, in the Adult/Adolescent section, registered on Jan 1, 2016, with Lateral Epicondylitis, referred by Dr. Lorenzo Lacson. An 'Activate' button with a refresh icon is next to the record. A 'Reactivate Patient Rec' button is also visible.

| Patient Number | Name | Age | Sex | Contact Number | Section | Date Registered | Medical Condition | Referring Physician | Activate |
|----------------|---------------------------------|-----|-----|----------------|------------------|-----------------|-----------------------|---------------------|----------|
| | Santos, William | 27 | M | +639176275086 | Adult/Adolescent | Jan 1, 2016 | Lateral Epicondylitis | Dr. Lorenzo Lacson | |

Figure 54. Inactive Patient Records list

The system administrator functionalities are limited to creating, updating, and deactivating user accounts and viewing the users' activity log.

The screenshot shows the 'User Activity Log' section. It has a blue header 'User Activity Log'. Below the header, there is a 'Show 10 entries' dropdown and a search box. The table has columns: Date, Time, Username, User Level, IP Address, and Activity. The activities listed are: FILED Feedback on Activity Plan, FILED PT Activity Plan for MARQUEZ, ANGELO, FILED Feedback on Activity Plan, FILED Feedback on Activity Plan, FILED Feedback on Activity Plan, FILED PT Home Program for MARQUEZ, ANGELO, FILED Feedback on Home Program, LOGGED OUT, LOGGED OUT, and LOGGED IN. At the bottom, it says 'Showing 51 to 60 of 84 entries' and has a pagination control with 'Previous', '1', '...', '5', '6', '7', '8', '9', and 'Next'.

| Date | Time | Username | User Level | IP Address | Activity |

Figure 56. Manage User Accounts window

Figure 57. Add User Account window

After an account has been created by the system administrator, the user receives an e-mail containing a link that will redirect him or her where he or she can activate the account.

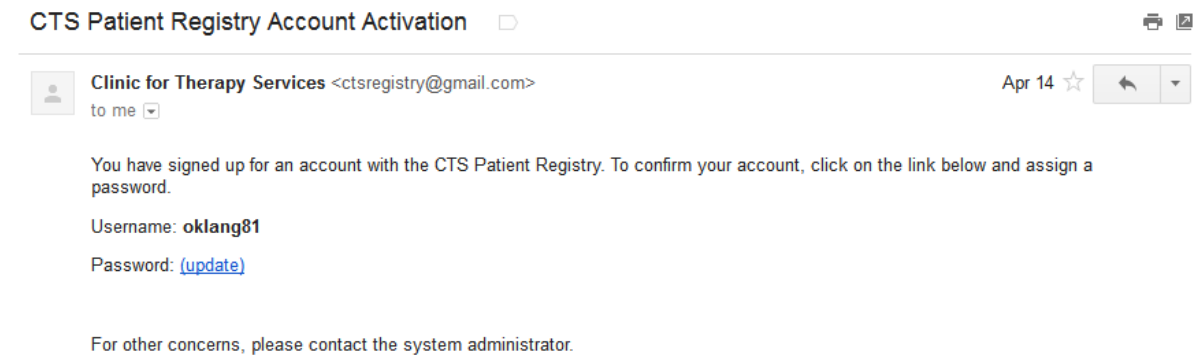

Figure 58. Account Activation E-mail

In case a user forgets his or her password, he or she can click on the link at the login page and enter the required account information. He or she is then sent an e-mail with a link that redirects to where he/she can update the password.

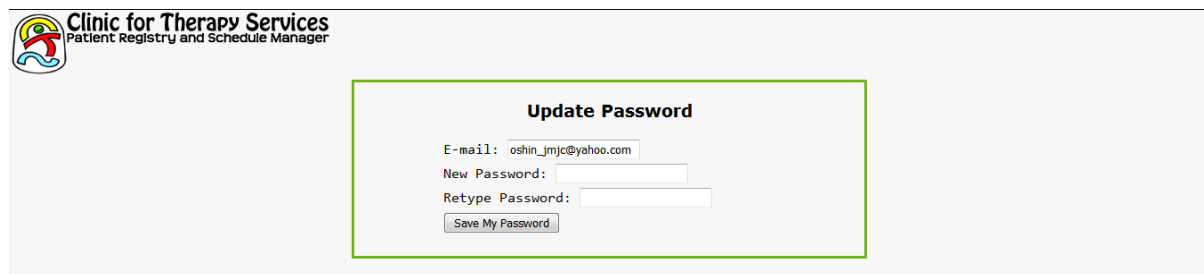

Figure 59. Password Update window

Using this web-based Patient Registry and Schedule Manager is pretty straightforward. It is able to computerize the processes of the CTS that are usually paper-based and time-consuming. Provided that the information entered by the users is accurate, it also ensures the integrity of the information presented in reports and helps avoid human errors and oversights.

VI. DISCUSSIONS

The Patient Registry and Schedule Manager for the Clinic For Therapy Services (CTS) is developed using CodeIgniter, a web application framework written in PHP that uses the model-view-controller architecture. It can be run on common Javascript-enabled web browsers.

Any person who wants to access the system has to coordinate with the system administrator for the creation of a user account. It is preferred that the system administrator is also personnel of the clinic. Since the system is dealing with confidential information, not everyone must be given access to it. Once an account has been created, the prospective user has to verify his or her account through a link sent through e-mail.

Some functionalities of the system are limited to certain user levels. For instance, only clerk-level users are able to create patient records, update and deactivate patient records. This is to ensure the integrity of data being stored in the system. The clerk can also send SMS reminders to patient about their upcoming appointments. This is executed through the Gammu SMS Daemon, a third-party application that must exist within the local server.

Likewise, only intern-level users are able to upload therapy notes after their sessions and supervisor-level users are able to provide their feedback. Scheduling of evaluations and therapy sessions is the duty of clerk-level users, similar to the paper-based workflow that CTS currently employs. The system, however, provides a more accurate and swift mechanism. As an additional layer of ensuring the security and integrity of data, the system also tracks the changes made by users to records which is quite a tedious job if done manually. Another task that the system can accomplish is the creation of attendance and income reports. Doing it through the system has a significant time difference compared to doing them manually.

VII. CONCLUSION

The Patient Registry and Schedule Manager for the Clinic For Therapy Services is a clinic-specific, web-based electronic medical record and appointment system that aids the Clinic For Therapy Services (CTS) of the University of the Philippines Manila College of Allied Medical Professions in their day-to-day operations by computerizing patient records and scheduling appointments through its calendaring functionalities.

With its ease of use and relatively low cost, the system is seen as an effective tool to help the CTS to provide better services and produce better outputs in terms of administrative performance. The system is able to provide the mechanism for storing and faster retrieval of patient records, compared to the manual filing in steel cabinets. This also allows the preparation of accurate and prompt reports, which in turn, saves the clinic personnel more time to do other tasks.

The scheduling functionalities ensure that waitlist entries are not overlooked, patients are reminded of their appointments, and schedules do not overlap. These features are necessary to help provide the finest healthcare the CTS is able to offer.

While there might still be more functionality to add or improve on, the system in its current state is sufficient to deliver the fundamental tasks of an electronic medical record and appointment manager that is suited for CTS.

VIII. RECOMMENDATIONS

The Patient Registry and Schedule Manager for the Clinic for Therapy Services (CTS) is a web-based electronic medical record system that can also facilitate scheduling of appointments. Since the CTS is also a venue for education and research for students and faculty of the College of Allied Medical Professions, it is useful that the registry of patient information would have functionalities that can assist in these activities. As such, it is recommended that, aside from the existing census reports, options to search through evaluation reports or therapy notes be added, with results that may be used by the clinic personnel for more thorough researches (ex. analysis of treatment plans on common diagnoses, comparison of different therapy approaches, etc.).

Finally, it is recommended to add functionalities for non-registered users such as viewing information about the clinic or inquiring about its services through e-mail or text messaging where responding may be handled by the system.

```

The Clinic for Therapy Services (CTS) is a college-based clinic of the University of the Philippines Manila - College of Allied Medical Professions (UP-CAMP) that provides a venue for service, training, and research for the students and faculty members.</p>

```
<p style="text-align: justify;
font-family: Verdana, Helvetica, Arial,
Sans-serif; font-size: 10pt; padding-
bottom: 3px;">
```

The college envisions the clinic to become a nationally recognized center that is responsive to the needs of Filipinos and that provides clinical education of the highest standard; offers programs and services that are innovative, collaborative and client centered; and generates knowledge through research that influence policies and practice in the allied health professions in the Philippines.</p>

```
<p style="text-align: justify;
font-family: Verdana, Helvetica, Arial,
Sans-serif; font-size: 10pt; padding-
bottom: 3px;">
```

With genuine concern for the Filipino people, CTS aims to provide the following:

```
<ul style="text-align: justify;
font-family: Verdana, Helvetica, Arial,
Sans-serif; font-size: 10pt; padding-
bottom: 3px;">
```

clinical education that is geared towards developing professional competencies that are built upon scientific and sound problem solving, and ethical and reflective thinking;

```
</li>
```

programs and services that are accessible to a greater number of Filipinos and serve the needs of people of different age groups and social roles; that target factors related to the individual, task and environment in preparation for integration into the community; and that emphasize collaboration in the care and prevention of disability and promotion of health and well-being;

```
</li>
```

new knowledge founded on scientific evidence and disseminated to a broad audience to promote and maintain best practice in the allied health professions in the country;

```
</li>
```

support for endeavors of the college that are geared toward uplifting education, service and extension, and research in the allied medical professions.

```
</li>
```

```
</ul>
```

```
</p>
```

```
<p style="text-align: justify;
font-family: Verdana, Helvetica, Arial,
Sans-serif; font-size: 10pt; padding-
bottom: 3px;">
```

Since 1992, the clinic has been providing quality physical, occupational and speech therapy services to children with developmental disabilities and other special needs. The clinic offers rehabilitation services to help children with Down syndrome, cerebral palsy, global developmental delay, autism, mental retardation, attention deficit hyperactivity disorder, cleft lip and palate, hearing impairment, and visual impairment among others. Some of the present programs of the clinic for the pediatric population include early intervention, developmental skills training, gross and fine motor skills training, activities of daily living training, sensory integration, cognitive training, behavior management, speech and language development, and feeding and dysphagia management.</p>

```
<p style="text-align: justify;
font-family: Verdana, Helvetica, Arial,
Sans-serif; font-size: 10pt; padding-
bottom: 3px;">
```

In 2002, CTS expanded its program to include rehabilitation services for adolescents with developmental disabilities and adults with a variety of musculoskeletal and neurological conditions. Some of the new programs that were developed because of this expansion include fitness training for adolescents and adults with neurologic conditions, home and workplace assessment, pre-vocational training, splinting, socialization training and voice rehabilitation.</p>

```
<p style="text-align: justify;
font-family: Verdana, Helvetica, Arial,
Sans-serif; font-size: 10pt; padding-
bottom: 3px;">
```

The Clinic for Therapy Services is a charity clinic which handles an average of a thousand patients per month. The families of most of these patients served by the clinic belong to the low-income bracket. They come from the different parts of Metro Manila, and from the nearby provinces of Cavite, Laguna and Bulacan.</p>

XI. ACKNOWLEDGEMENTS

This is where I say, with all conviction, FINALLY! Much of these thanks have been too long overdue.

First, my family (Maligaya Compound!) deserves all the gratitude. Daddy and Mama, I'm finally done! Despite all the delays, thank you for believing I can finish. Thank you for the subtle pressures that pushed me to accomplish this. Now, we're on to the next! Ate and Allen, thank you also for being supportive. I really appreciate all your provisions and cheers for me. Love you fambam! ☺

To my advisers, thank you so much for the pieces of advice. Sir Geoff Solano, I am grateful most especially for the efforts you made just so a delinquent advisee like me could concentrate on working on this SP. Ma'am (Ate) Perl Gasmen, thank you for taking me under your charge so I could finally finally present this. The completion of this project would not have been possible without all your help. To the other Computer Science professors and instructors, thank you for the lessons, in and out of life. To the whole Department of Physical Sciences and Mathematics, my stay in UP Manila has been worthwhile because of you. Thank you very much!

I'd also like to express gratitude for my resource persons, from the College of Allied Medical Professions OT Batch 2007, Shie Gajelonia, Gi Bautista, Krizza Amonceda, and Dom Cheoc, all your inputs have been very valuable to this project. Thank you for the insights on the clinical processes and for the notes and comments on how I could make the system better. I owe you a lot! To Sir Fer Mendoza, Ma'am Aila Bandong, and Ms. Alma Labro, thank you for letting me in CTS and showing me the ropes of your operations. Thank you also for the ideas that you offered to help me improve the system. My exposure to CTS has ingrained in me a deeper understanding and compassion for your clients and vocation. Thank you so much!

To my SP Support Group! Another one bites the dust ☺ Thank you Josha, Pash, Ruru, and Ejae! Though our efforts to "push" each other in finishing earlier may have failed, you've all been helpful and instrumental in my completion. Thank you for your answers to my endless questions! Pash and Ejae, I know you'll get here soon too! To my constant support since childhood, Decaloves ♥, thank you for your encouragement since the beginning, whether through my period of hermitage or when I just wanted to give up already. I love you always!

To my intercessors, St. Jude and Our Mother of Perpetual Help, thank you for the guidance and intercessions. I owe your shrines some visits. Most and definitely the greatest of all, I offer my glory, praise, and utmost acknowledgements and gratitude to God, without whom, none of these accomplishments would have been possible. *Ut In Omnibus Glorificetur Dei!*
