

I. Introduction

A. Background of the Study

Pets, either professionally trained or average domestic have various benefits to humans. Guide for the blind, ease loneliness, reduce stress, promote social interaction, encourage exercise and playfulness are some benefits of having a pet. Caring for a pet may also help a person live longer. [1]

Human health is inextricably linked to animal health and production. [2] One of the most enriching and delightful experience in life is to own a pet. [3] Pets help a person to become more responsible, when they get a pet there is no doubt they will take care of them. The life and death of another being on their hands makes them become a more responsible person. They learn to manage their time, since it will surely take a significant amount of their time taking care of pets. They will become a more nurturing and caring person. The emotional link between them and their pet could both last for a lifetime. And surely, they'll get a better health.

However, there are some cases that a person is not allowed to have a pet, or if they do they must know the potential risk for diseases that can be passed from animals to humans. Also during these cases, the service of veterinary clinic is important. Veterinarians could give a person all information they need on infections that they might get from their pets. Veterinarians could also examine all their pets and give their pet vaccinations if necessary.

In Philippines, availability of information about location of veterinary clinics, specialization and services of veterinarians is very limited. This information would be beneficial in helping the companion animals for protection as well as for being able to protect people from diseases that could be transferred from animals to human.

From an interview with one of the veterinarians of UP Veterinary Hospital located inside UP Diliman, veterinary clinic/hospital operations are basically the same as operations of human hospitals aside from the difference of whom to be treated. The same procedures are followed on treating animal's diseases, confinement and operation. Veterinarian's specialization is almost the same as normal doctor's specialization. But even though the facilities and technology used for treatment of animal disease are modern, there are no applications or automated systems used for maintaining animal data records. Specifically in UP Veterinary Hospital, manual input of animal records are done by hospital secretary, transactions from registration to payment are done manually as well.

B. Statement of the Problem

The essential role of animals in the transmission of infectious diseases has long been recognized. Not only were animals known to be responsible for the maintenance of infections in nature by harboring and enabling pathogens to survive; animals were also found to be an active cause of pathogen spread in the environment and to other animals, including man. [4]

Availability of information about veterinary clinics that could help prevent the transmission of infectious diseases from animals is very limited. It is hard to find the nearest veterinary clinic that could cater the needs of pet owners with the current available systems on the internet.

Information on the internet sometimes lack details on services and specialization of veterinary clinics thus leading pet owners on wrong clinic. This causes loss in time, effort and even money for both the pet owner and the clinic.

C. Objectives

The project aims to create a Web and Android-based application that would provide necessary information to pet owners of the location, and specialization of the nearest veterinary clinic. It aims to help them find or search the most suitable clinic to cater their pet's needs.

General Features/Functionalities:

- Allow users to issue queries on the nearest veterinary clinic available to their location.

The system will use an online interactive map service (Google Maps) to show the nearest search results.

- Allow users to view information on each clinic available on the system.
- Allow users to view information about veterinarians and their schedule.
- Allow veterinarians to enter consultation information, along with the laboratory results and medication

Allow users to schedule appointment with a veterinarian on the clinic.

Specific functionalities for each access levels:

Web-based application:

1. To allow registered users with the following roles to:

Pet Owner:

- a. View own profile
- b. Update personal information
- c. View clinics' information
- d. Request schedule for consultation

- e. View own pet information
- f. Add own pet information
- g. Update own pet information

Clinic Owner:

- a. Request for clinic account
- b. View clinic information
- c. Update clinic information
- d. View own veterinarian information
- e. Add veterinarian to system and clinic
- f. View own veterinarian schedule

Veterinarian:

- a. View own information
- b. Update own information
- c. View pet information
- d. View servicing clinic information
- e. View personal schedule
- f. Update personal schedule
- g. Add pet information result from consultation
- h. Approve appointment request from client

2. To allow the System Administrator who maintains the overall system's database to:

- a. Approve new clinic request
- b. Deactivate or activate an existing clinic account

Android application:

To allow all users to:

- a. Search available veterinary clinic based on location
- b. View clinic information
- c. View veterinarian information

D. Significance of the Study

Looking for a good veterinarian to cater pet owner needs with less time taken than usual, this system would create a way to connect more pet lovers to veterinarians and the community.

Animal diseases that human can catch are called zoonoses. Pets are no exception with possibility to carry worms, viruses, and bacteria causing disease that is transferrable to human [5], thus regular consultation on veterinarians is important. By providing the necessary information on location, specialization and services on veterinary clinics, pet owners could protect their beloved companion and themselves from this kind of disease.

It helps reduce anxiety for pet owners or users looking for clinics for their pet to be checked or cured. Scheduling visit and consultation will also not be a problem. Pet records and medical history are maintained and keep secured by the system.

E. Scope and Limitations

1. Only information of registered clinics is available.
2. Accuracy of information, data or location is based from the data provided by clinic and not automatically obtained by the system.

3. Speed of queries is based on internet connection speed.
4. Only covers veterinary clinics located in the Philippines.
5. Veterinarian account can only be created by registered clinic
6. Pet owner account can only be created by registered veterinarian
7. Only legally allowed pets are considered as type of pet and veterinarian's specialization
as of this development

II. Review of Related Literature

Medical informatics is the discipline concerned with the theoretical foundations and application of information science, engineering, and computer technology in medical teaching, research, and practice. [6] Medical informatics areas are an integral part of veterinary practice – for example, digital radiology and patient information software. Though information systems for practice management and health are common, there is only minimal system that caters the need for veterinary medicine. A greater understanding of the informatics environment of veterinary practice is necessary to promote the integration of knowledge base resource in veterinary practice. [7]

Web-Based Integrated Information System of Phoenix Veterinary Clinic in Cagayan de Oro City, Philippines is a system designed for quick and easy retrieval of pet records. It is used to provide reliable and secured data preservation for the clinic. With the use of the system, the clinic can operate more efficiently because every information is managed electronically. [8]

There are also available software systems to control, help and improve the current process implemented. One example of this is CryoWEB. CryoWeb is web software used for the documentation of cryo-preserved material in animal gene banks. The software is generally applicable to all livestock breeds, independent of donors' species and type of preserved animals. It also provides a way to trace the usage of the sample gene and the sample vessel within the storage facilities. [9]

A Geographic Information System (GIS) is an integrated collection of computer software and data used to view and manage information connected with specific locations, analyze spatial relationships, and model spatial processes. It can be used to provide information on affected

location that is critical to decision making associated with large outbreaks, whether animal or human. Animal health authorities stated that GIS is one of the most powerful weapons they have to control diseases and minimize economic loss. [10]

Nearest Hospital Search and Inquiry System (NHSIS) is a Special Problem made by Meybel R. Martinez on 2004. NHSIS is a location based system designed to locate the nearest hospitals from user's location. It is a web-based application that generates clinical data provided by the registered hospitals. It allows both registered and general users to issue their queries on the hospital nearest to their location, doctors' schedule of activities and the list of available facilities and specialties. [11]

Later on during 2010, another Special Problem was made, Telehealth's Geographic Information System (TGIS) by Alexis Angelo Sadie. One of its objectives is to provide data analysis to map and track origin of outbreak for diseases. It includes maps and charts in presenting analyzed data. It uses Geographic Information system for a better visualization of the geographical location associated with a specific study. It also integrates the result of NHSIS as support for locating nearest hospitals. [12]

Web-based geographic search engine for location-aware search in Singapore – is a WEB-based search engine that enables user to search local specific location in Singapore and return the distance from the current user's location. The user can view the searched location on a satellite map instead of the traditional two dimensional map currently used in street view directories. It uses Haversine's formula to calculate the distance between two coordinates. Whereas, the user is required to input their current coordinate, then this coordinate is used during search to be able to return the distance from user's current location and the searched location. [13]

Geospatial health resource data and improved software analysis enable development of digital “health maps”. The information derived from GIS-based descriptive maps provides an operational tool for planning, monitoring and managing control programs for infectious diseases. [14]

GIS-Enabled Cancer Atlas is a client-server application designed to provide information related to cancer-control activities. The system is designed primarily to enable web distribution of maps to support public health activities related to cancer. It uses GIS as a tool to integrate, analyze, and present geo-referenced data about cancer and associated covariates and risk factors. The Pennsylvania Cancer Atlas (PA CA) for example, is designed to serve not as a product for public use but as a model for the kind of atlases that state departments of public health, state cancer registries, and related organizations can implement to disseminate the data they generate and to help users understand these data. [15]

Web Based Bicycle Trip Planning for Broward County, Florida is a GIS application designed to promote bicycle as mode of transportation for increasing urban traffic congestion. It uses ArcGIS Sever framework with ArcGIS JavaScript Extension for Google Maps API and the Google Local Search Control for Maps API that allows user to access local search results from businesses, addresses, road and intersections, political entities to geographic coordinates. [16]

Implementation of Location based Services in Android using GPS and Web Services uses Android’s build in support for location base services that allows mobile user to exploit their knowledge of the geographical position and use that information to provide different kind of services like advising clients of current traffic conditions, providing routing information, helping them find nearby hotels. [17]

Restaurant Finder is an Android application that helps users to find the restaurants according to their preferences. It provides easy access to nearby restaurants and its location on map. It allows user to search by category such as type of cuisine, rating of restaurants and distance from current location. The application also provides opportunity for customers to write reviews and ratings for the restaurant's service. With the use of Google Maps API it allows users to view top five (5) restaurants present in the current location and it also provides route to the restaurants. The application also makes it easy for the user to send out invitations to his/her friends/colleagues for meetings and also mark the events in their calendar. [18]

Women Veterans' Experience with a Web-Based Diabetes Prevention Program: A Qualitative Study to Inform Future Practice, is a Web-based DPD intervention that aims to qualitatively explore women veterans' early experiences with diabetes, estimate weight loss, participation and engagement to provide context for its findings. Participants perceived the DFD program as an appealing way of initiating lifestyle changes and made them feel accountable in achieving their daily goals. The online program was convenient because it could be accessed at any time, and many found that it integrated well into daily life. [27]

Exploring the Far Side of Mobile Health: Information Security and Privacy of Mobile Health Apps on iOS and Android establish an overview of Mobile health (mHealth) apps offered on iOS and Android with a special focus on potential damage to users through information security and privacy infringements. Through this study, it is found that various kinds of mHealth apps collect and offer critical, sensitive, private medical information, calling for a special focus on information security and privacy of mHealth apps. In order to foster user acceptance and trust, appropriate security measures and processes need to be devised and employed so that users can

benefit from seamlessly accessible, tailored mHealth apps without exposing themselves to the serious repercussions of information security and privacy infringements. [28]

III. Theoretical Framework

A. Pet Medical Record

Many veterinary medical offices have changed their system of recordkeeping from a handwritten one to electronic system. Whether a veterinary practice keeps medical records in a handwritten format or in an electronic format, the same rules applies; there is no single standard of completeness for each record. However, medical records should contain the following key elements; client complaints, vaccination or preventive health update, assessments, full prescription information, and one of the 3 R's (recheck/recall/reminder).

This SP serves as an information system for pet medical records. It stores data from appointment to medication and will be available from the time they used the system. The information stored may be used as reference if needed, be it future use or for practice of veterinary medicine.

B. Android OS

Android or Android OS is the operating system that powers more than one billion smartphones and tablets. [19] It is based on Linux kernel and currently developed by Google and primarily designed for touchscreen devices. On top of the Linux kernel, there are the middleware, libraries and APIs written in C, and application software running on an application framework which includes Java-compatible libraries. This enables any android device the ability to evolve, and open the possibility of new android application to be developed.

Android applications are usually developed in the Java programming language using the Android Software Development Kit (SDK). The Android SDK provides a fast and reliable

development environment for building, testing, and debugging Android applications in Windows, Mac or Linux. It gives mobile developers the chance to play around with the new platform. It contains everything you need to start building applications, as well as a fully functional device emulator for testing out when you've finished.

C. Geographic Location Systems

Geographic location systems or coordinate systems were developed as a tool to describe specific geographic locations and are used for navigation and mapping. Most of these systems use coordinate values, which are expressed as numeric or alphanumeric characters, to define geographic locations. Coordinate systems are based on reference points from which position measurements are made. [20]

Coordinate systems enable geographic datasets to use common locations for integration. A coordinate system is a reference system used to represent the locations of geographic features, imagery, and observations, such as Global Positioning System (GPS) locations, within a common geographic framework. It is a measurement framework, which either two geographic or planimetric coordinates of the earth and is projected onto a two-dimensional planar surface. It uses feet or meter for projected coordinate systems or decimal degrees for latitude-longitude. [21]

D. Google Maps

Google Maps is a Web-based service that provides detailed information about geographical regions and sites around the world. In addition to conventional road maps, Google Maps offers aerial and satellite views of many places. It serves as a route planner that offers

directions or uses of public transport. Google Maps API makes it possible for Web site administrators or designers to embed Google Maps on their applications. Google Street View enables user to view and navigate through the horizontal and vertical panoramic street level images. [22]

E. JavaScript Object Notation (JSON)

JavaScript Object Notation (JSON) is a lightweight data-interchange format. It is easy for humans to read and write. It is easy for machines to parse and generate. JSON is a text format that is completely language independent but uses conventions that are familiar to programmers of the C-family of languages, including C, C++, C#, Java, JavaScript, Perl, Python, and many others. These properties make JSON an ideal data-interchange language. [23]

JSON is built on two structures:

1. A collection of name/value pairs. In various languages, this is realized as an object, record, struct, dictionary, hash table, keyed list, or associative array.

```
{ string 1 ; value 1, string 2 ; value 2, string ... ; value ... } <- object
```

Figure 1. JSON representation of an object

2. An ordered collection of values. In most languages, this is realized as an array, vector, list, or sequence.

```
[ value 1, value 2, value ... ] <- array
```

Figure 2. JSON representation of a list

An Android application and a remote MySQL database cannot communicate with each other directly. By utilizing PHP to send query and return it in JSON format, it is possible for an Android application to connect and obtain data from a database.

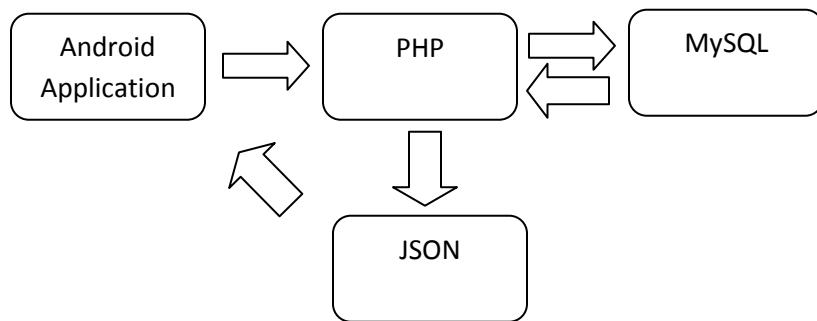

Figure 3. Process in communicating Android application and a remote MySQL database

As of PHP 5.2.0, the JSON extension is bundled and compiled into PHP by default.

```
$arr = array('a' => 1, 'b' => 2, 'c' => 3, 'd' => 4, 'e' => 5);  
echo json_encode($arr);
```

Figure 4. Sample code snippet on converting arrays into JSON using PHP

PHP When executed, this will produce the following result:

```
{"a":1,"b":2,"c":3,"d":4,"e":5}
```

Figure 5. JSON result for PHP code in Figure 4

F. The Google Geocoding API

Geocoding is the process of converting addresses (like "1600 Amphitheatre Parkway, Mountain View, CA") into geographic coordinates (like latitude 37.423021 and longitude -122.083739), which you can use to place markers or position the map. [24]

A Geocoding API request must be of the following form:

<https://maps.googleapis.com/maps/api/geocode/output?parameters>

where output may be either of the following values:

- json (recommended) indicates output in JavaScript Object Notation (JSON)
- xml indicates output as XML

```
{
  "results" : [
    {
      "address_components" : [
        {
          "long_name" : "Manila",
          "short_name" : "Manila",
          "types" : [ "locality", "political" ]
        },
        {
          "long_name" : "Metro Manila",
          "short_name" : "NCR",
          "types" : [ "administrative_area_level_1", "political" ]
        },
        {
          "long_name" : "Philippines",
          "short_name" : "PH",
          "types" : [ "country", "political" ]
        }
      ],
      "formatted_address" : "Manila, Metro Manila, Philippines",
      "geometry" : {
        "bounds" : {
          "northeast" : {
            "lat" : 14.6390175,
            "lng" : 121.0261686
          },

          }
        },
        "location" : {
          "lat" : 14.5995124,
          "lng" : 120.9842195
        },
        "location_type" : "APPROXIMATE",
        "viewport" : {
          "northeast" : {
            "lat" : 14.6390175,
            "lng" : 121.0261686
          }
        }
      }
    }
  ]
}
```

```

        },
        "southwest" : {
            "lat" : 14.5571256,
            "lng" : 120.9331339
        }
    },
    "place_id" : "ChIJi8MeVwPK1zMRH8FpEHXV0Wk",
    "types" : [ "locality", "political" ]
}
],
"status" : "OK"
}

```

Figure 6. JSON output for

<https://maps.googleapis.com/maps/api/geocode/json?address=manila>

The values on lat and lng under “location” string will be used for Haversine computation.

Whenever possible the value to be used will be based on location type result base on the following indicator:

- "ROOFTOP" restricts the results to addresses for which we have location information accurate down to street address precision.
- "RANGE_INTERPOLATED" restricts the results to those that reflect an approximation (usually on a road) interpolated between two precise points (such as intersections). An interpolated range generally indicates that rooftop geocodes are unavailable for a street address.
- "GEOMETRIC_CENTER" restricts the results to geometric centers of a location such as a polyline (for example, a street) or polygon (region).
- "APPROXIMATE" restricts the results to those that are characterized as approximate.

G. Haversine

The Haversine formula is an equation important in navigation, giving great-circle distances between two points on a sphere from their longitudes and latitudes. [25]

Haversine formula:

$$a = \sin^2(\Delta\phi/2) + \cos(\phi_1) * \cos(\phi_2) * \sin^2(\Delta\lambda/2)$$

$$c = 2 * \text{atan2}(\sqrt{a}, \sqrt{1-a})$$

$$d = R * c$$

note: where ϕ is latitude, λ is longitude, R is earth's radius (mean radius = 6,371km)

(that angles need to be in radians to pass to trig functions) [26]

By using the latitude and longitude value we get on Google Geocoding API and this formula we could determine the nearest veterinary clinic within the area.

IV. Design and Implementation

A. Context Diagram

Overall interaction of all external entities that have direct use and access to the application is shown in Figure 7. SpotAVet have five main role types namely: Clinic Owner, Veterinarian, Pet Owner, System Administrator, and the non-registered users or guests.

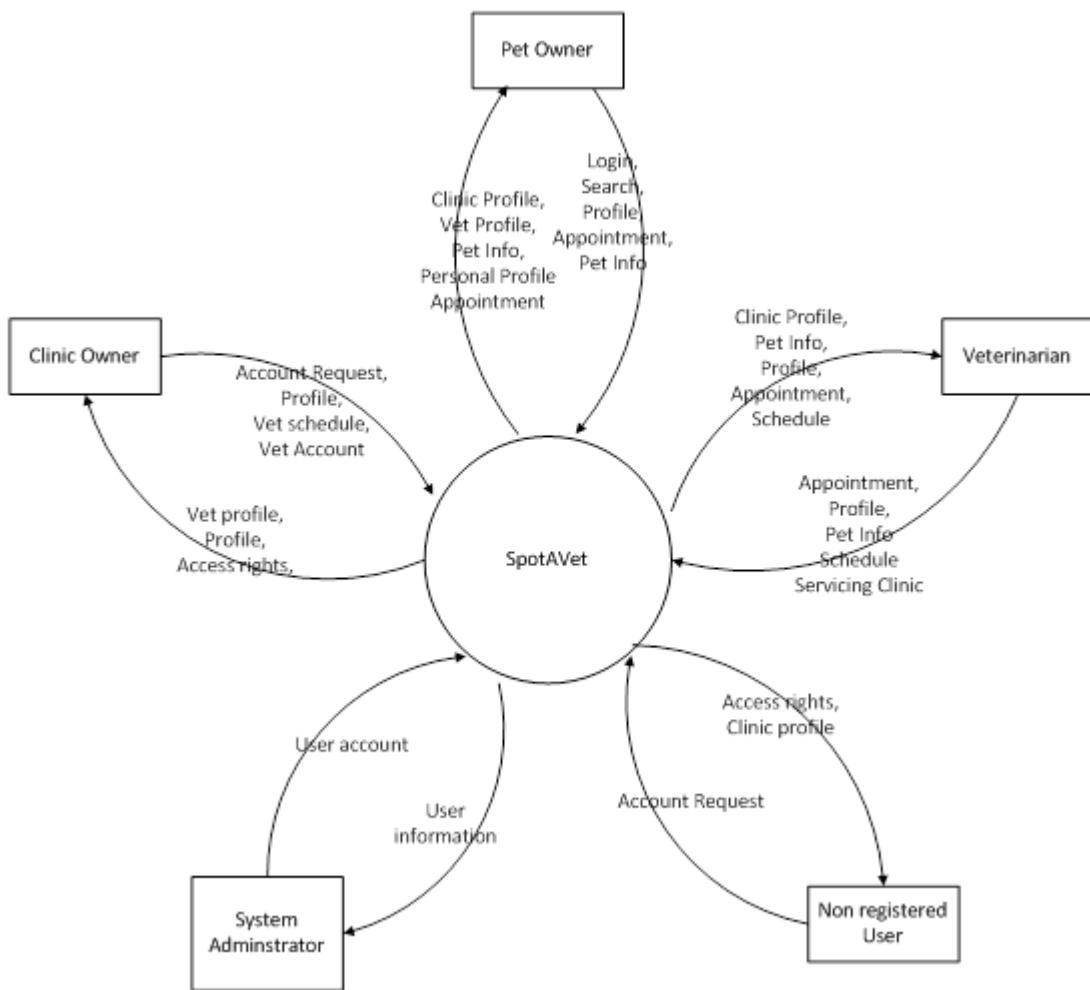

Figure 7. Context Diagram of SpotAVet

B. Data Flow Diagram

The top-level data flow diagram is shown in Figure 8. It represents the relationships between the various components and entities that are included in the system

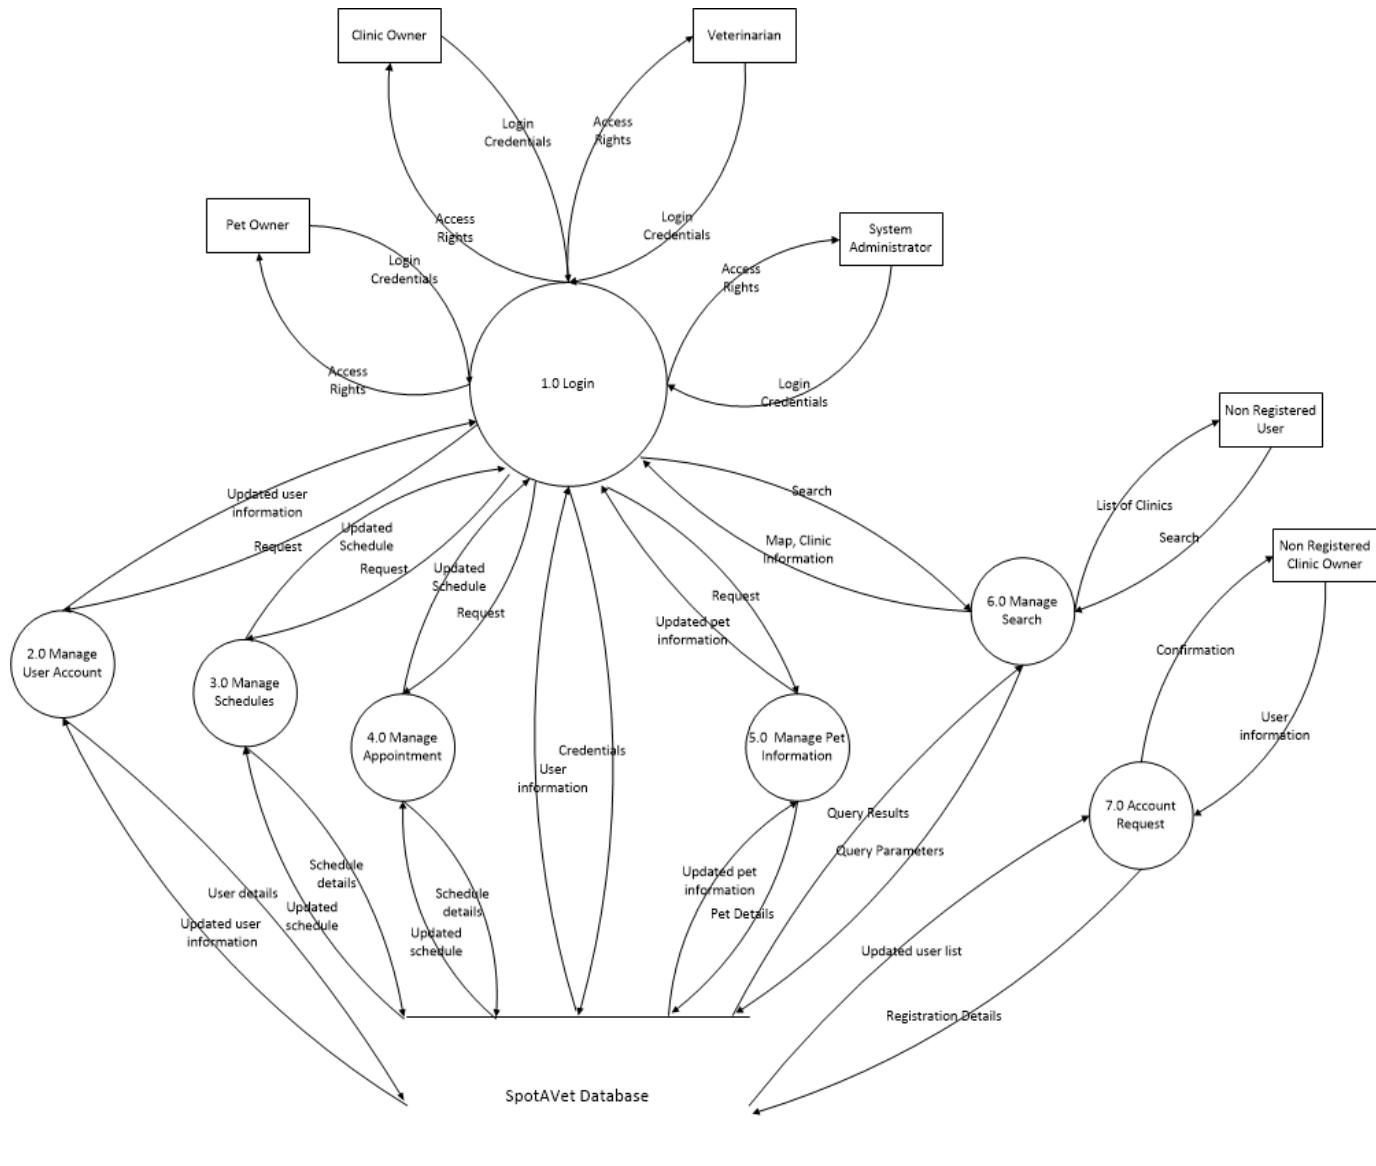

Figure 8. Top Level Data Flow Diagram of SpotAVet

All users who intend to use the system go through the login process (refer to Figure 9: Login Process). Credentials (username/password) assigned for each user are used during login process. It is then checked if same matches the data from database. The system notifies the user for both successful and failed login attempts.

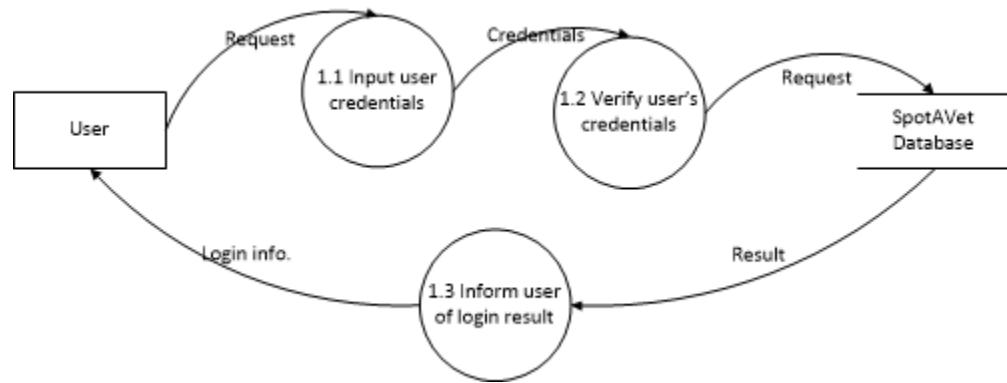

Figure 9. Sub-explosion Level 1 – 1.0 Login

System administrator has full control on all accounts used to access the application. Approval of new clinic account request, as well as activating and deactivating it are roles that the system admin is capable of.

Other users of the application (Clinic Secretary, Pet Owner and Veterinarian) are able to update information associated to them. Editing information is only allowed for fields that are not needed as unique (i.e., address). All changes on user information are subject to system verification.

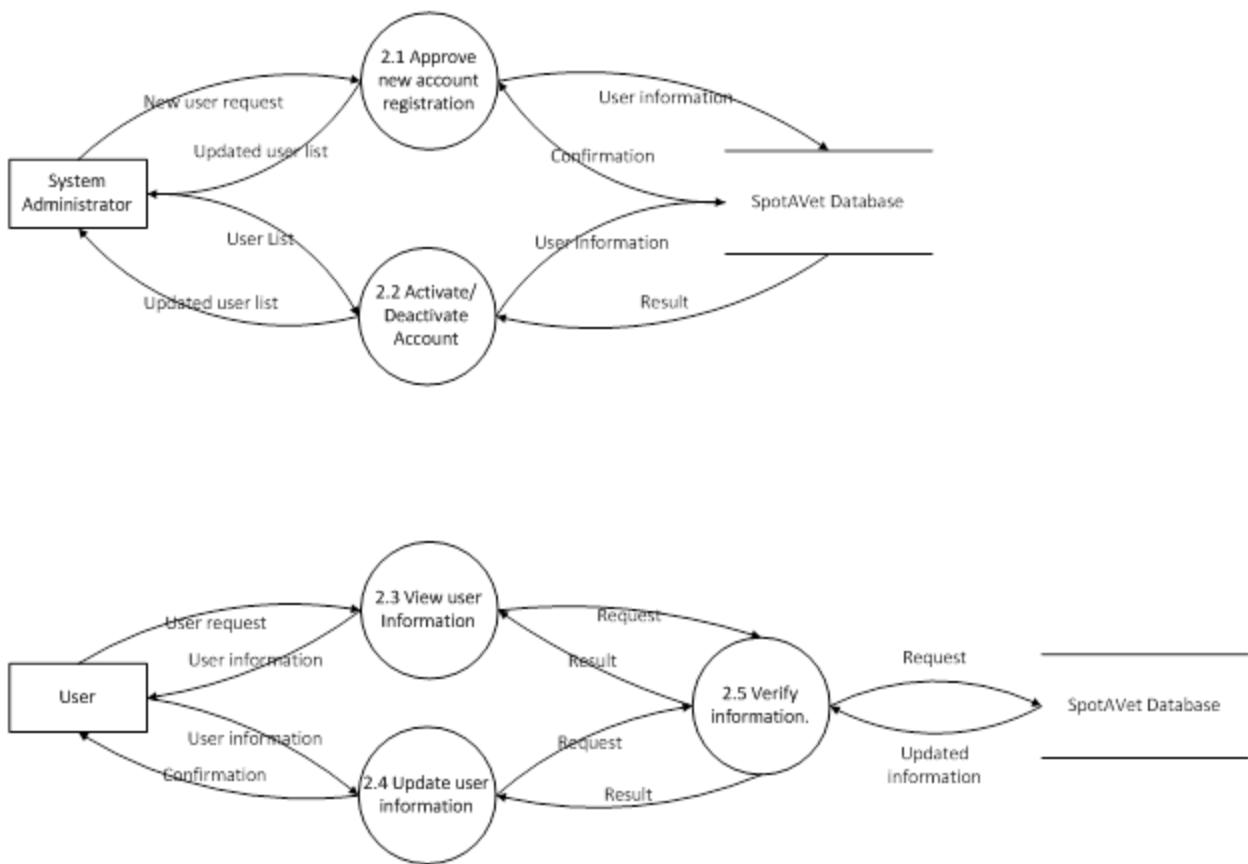

Figure 10. Sub-explosion Level 1 – 2.0 Manage User Account

Veterinarian's schedule is controlled by the veterinarian itself. Veterinarians are only allowed to make changes on its own schedule per servicing clinic. This is applicable to clinic schedule or operating hours, only the clinic owner is allowed such change in schedule.

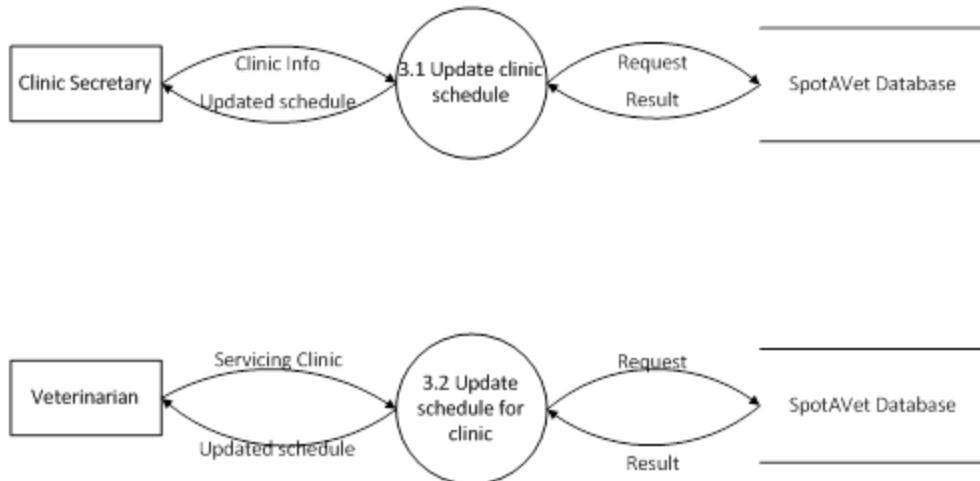

Figure 11. Sub-explosion Level 1 – 3.0 Manage Schedule

When the pet owner decides to make an appointment, it is required to do the search as first step (refer to Sub-explosion Level 1 of Manage Search). At the end of the search, pet owner chooses the veterinarian to set up schedule with, fill up all necessary information and make a request.

When the veterinarian received an appointment request, the vet reviews the request and decides whether to accept or decline the request. If a request is declined, the veterinarian needs to provide information on why the request is declined and the appointment is updated.

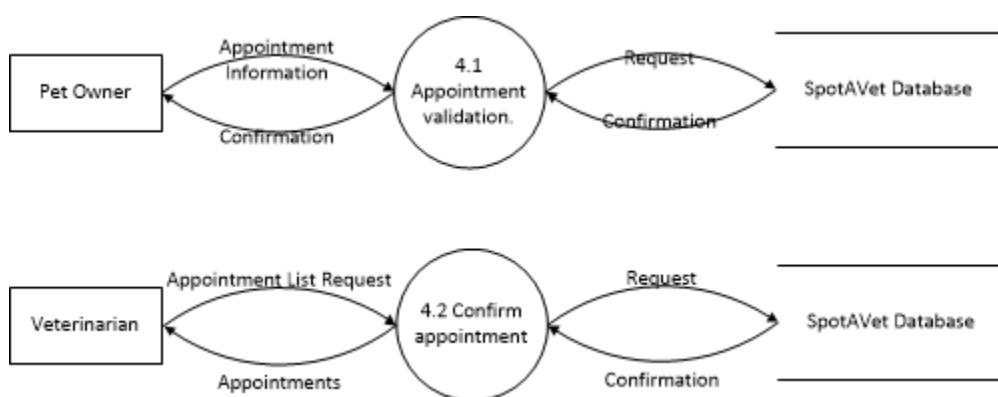

Figure 12. Sub-explosion Level 1 – 4.0 Manage Appointments

Before a pet owner can set appointment it is required to register the pet that will undergo examination/checkup. In the occurrence that pet information must be updated, pet owners have the right to update its pet information.

Every after examination, veterinarians are required to update the pet information for the result, this will serve as the medical history for the pet. In case of walk-in patient and unregistered owner, veterinarians can create account for the owner and initial profile for the pet, as well as the result of the consultation.

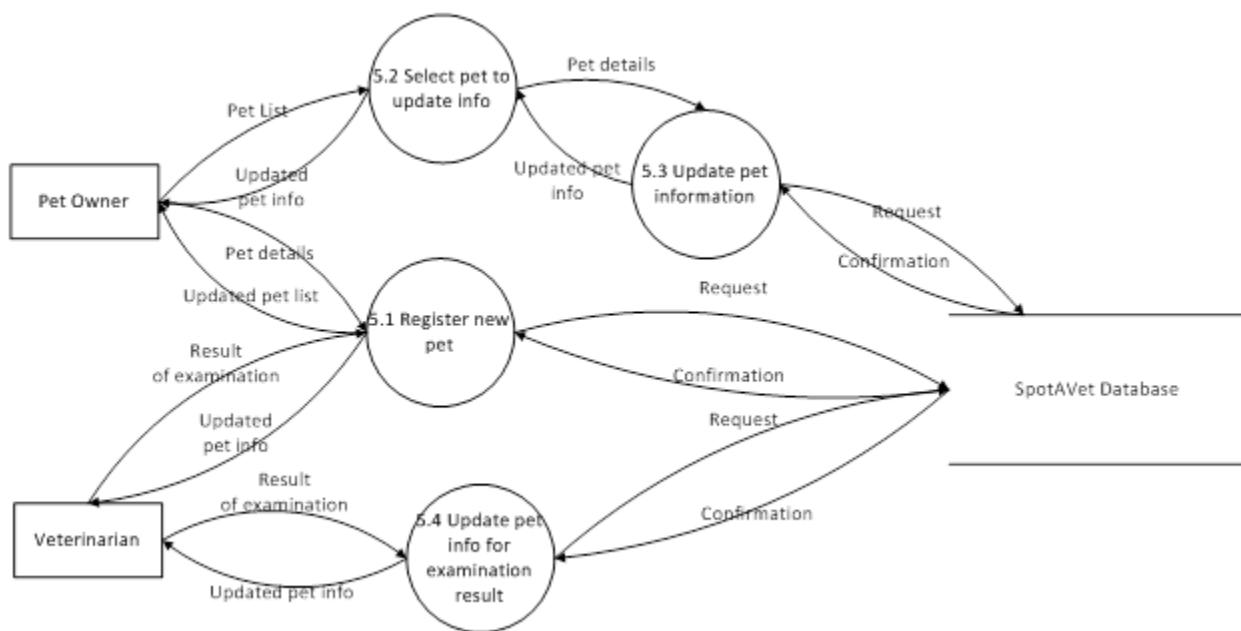

Figure 13. Sub-explosion Level 1 – 5.0 Manage Pet Information

Pet owner is allowed to filter search conditions such as veterinarian name and clinic name. This will then show list of clinic that have match on the set conditions. From the list, select the clinic and the list of veterinarian and schedule is shown. Select the veterinarian and from there you can set an appointment (refer to 4.0 Manage Appointments).

Non registered users can search clinic nearest to current location, but is not able to set appointment.

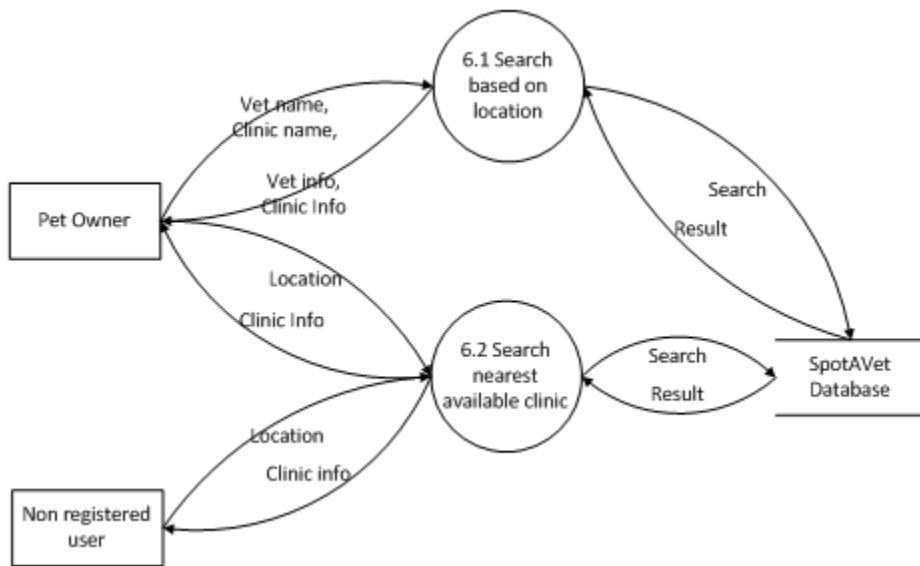

Figure 14. Sub-explosion Level 1 – 6.0 Manage Search

Non-registered clinic owners can fill up registration form with desired account information and then submit to the system. It is then queued to System Admin for approval (refer to 2.0 Manage User Account). Upon approval the account can already be used to access the application.

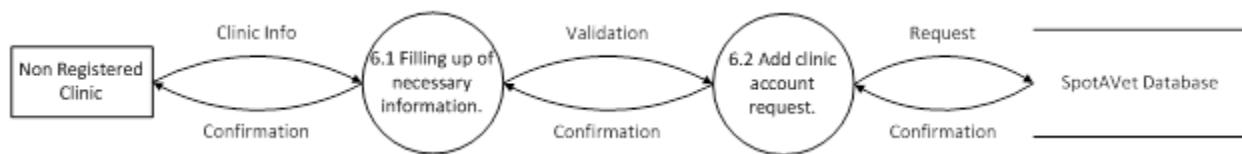

Figure 15. Sub-explosion Level 1 – 7.0 Account Request

C. Entity Relationship Diagram

The system is following the specific design for database shown in Figure 16.

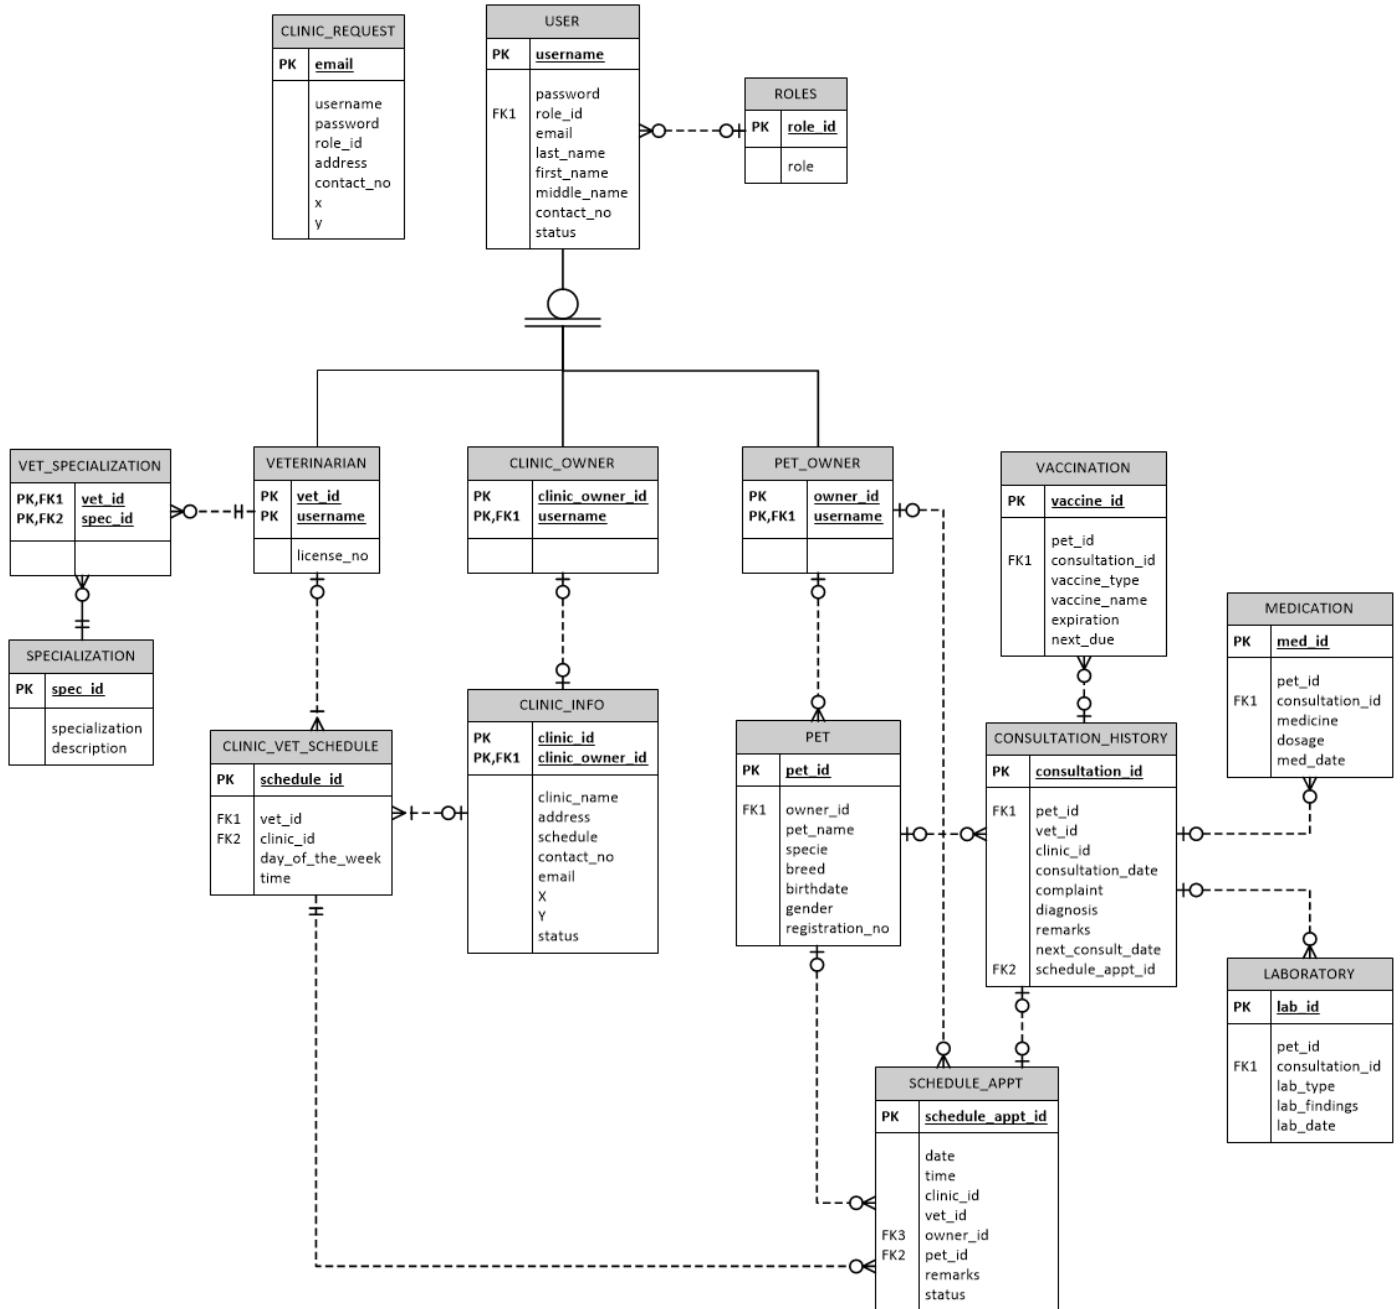

Figure 16. Entity Relationship Diagram of SpotAVet.

D. Database Table

The database consists of tables containing all information necessary for the system to function such as CLINIC_REQUEST, USER, ROLES, VETERINARIAN, CLINIC_OWNER, PET_OWNER, VET_SPECIALIZATION, SPECIALIZATION, CLINIC_INFO, CLINIC_VET_SCHEDULE, PET, SCHEDULE_APPT, CONSULTATION_HISTORY, MEDICATION, LABORATORY and VACCINATION. Primary Key = (pk) and Foreign Key = (fk).

Data Field	Data Type	Description
username	VARCHAR(50)	Username for system login.
password	VARCHAR(50)	Password for system login. Must be a minimum of six (6) alpha numeric characters.
email (pk)	VARCHAR(100)	Email ID for registration confirmation.
role_id	INTEGER(5)	Integer value that defines the type of user to be registered.
address	VARCHAR(200)	Clinic's street name. May include house no etc.
contact_no	VARCHAR(50)	Clinic's contact number(s).
x	FLOAT(11, 7)	X – longitude. Clinic's address location on map.
y	FLOAT(11, 7)	Y – latitude. Clinic's address location on map.

TABLE 1: CLINIC_REQUEST contains new clinic information that requests access to the system

Data Field	Data Type	Description
username (pk)	VARCHAR(50)	Username for system login.
role_id	INTEGER(10)	1 – ADMINISTRATOR, 2 – CLINIC OWNER, 3 – VETERINARIAN, 4 - PET OWNER
password	VARCHAR(50)	Password for system login. Must be a minimum of six (6) alpha numeric characters.
last_name	VARCHAR(50)	User's last name.
first_name	VARCHAR(100)	User's first name.
middle_name	VARCHAR(50)	User's middle name.
contact_no	VARCHAR(50)	User's contact number.
email	VARCHAR(100)	Email ID used upon registration.
status	INTEGER(1)	0 – non active users, 1 – active users, 2 – pending

approval

TABLE 2: USER contains all registered users of the system

Data Field	Data Type	Description
role_id	INTEGER(5)	Role identification number
role	VARCHAR(20)	Roles per user in the system. 1 – ADMINISTRATOR, 2 – CLINIC OWNER, 3 – VETERINARIAN, 4 - PET OWNER

TABLE 3: ROLES contains all registered users of the system

Data Field	Data Type	Description
vet_id (pk)	INTEGER(5)	Veterinarian's Identification number (system generated)
username (pk, fk)	VARCHAR(50)	Username associated with the client.
license_no	VARCHAR(50)	Veterinarian's license number.

TABLE 4: VETERINARIAN contains all registered users with type VETERINARIAN in the system

Data Field	Data Type	Description
clinic_owner_id (pk)	INTEGER(10)	Clinic Owner's Identification number (system generated)
username (pk, fk)	VARCHAR(20)	Username associated with the client.

TABLE 5: CLINIC_OWNER contains all information about clinic owner

Data Field	Data Type	Description
owner_id (pk)	INTEGER(10)	Pet owner Identification number (system generated)
username (pk, fk)	VARCHAR(50)	Username associated with the client.

TABLE 6: PET_OWNER contains all registered user information with type PET OWNER in the system

Data Field	Data Type	Description
vet_id (pk, fk)	INTEGER(5)	Veterinarian's Identification number (system generated)
spec_id (pk, fk)	INTEGER(5)	Specialization identification number.

TABLE 7: VET_ SPECIALIZATION contains details of all VETERINARIAN specialization

Data Field	Data Type	Description
spec_id (pk)	INTEGER(5)	Veterinarian's Identification number (system generated)
specialization	VARCHAR(50)	Types of veterinarian's specialization.
description	VARCHAR(50)	Description for each specialization.

TABLE 8: SPECIALIZATION contains details of all SPECIALIZATION available on veterinary medicine

Data Field	Data Type	Description
clinic_owner_id (pk, fk)	INTEGER(10)	Clinic secretary Identification Number (system generated)
clinic_id (pk)	INTEGER(10)	Clinic Identification Number (system generated)
clinic_name	VARCHAR(100)	Clinic's name or company name.
address	VARCHAR(200)	Clinic's complete address.
contact_no	VARCHAR(50)	Clinic's contact number(s).
X	FLOAT	X – longitude. Clinic's address location on map.
Y	FLOAT	Y – latitude. Clinic's address location on map.

TABLE 9: CLINIC_INFO contains all information about the registered clinics

Data Field	Data Type	Description
schedule_id (pk)	INTEGER(10)	Schedule ID
vet_id (fk)	INTEGER(5)	Veterinarian's Identification number (system generated)
clinic_id (fk)	INTEGER(5)	Clinic Identification Number (system generated)
schedule	VARCHAR(200)	Complete schedule of veterinarian for each clinic

TABLE 10: CLINIC_VET_SCHEDULE contains schedule of all veterinarian in different clinic.

Data Field	Data Type	Description
pet_id (pk)	INTEGER(5)	Pet's ID.
owner_id (fk)	INTEGER(5)	Pet owner's ID.
registration_no	VARCHAR(50)	Registration number of the pet.
specie	VARCHAR(50)	Type of pet.

breed	VARCHAR(50)	Specific breed of pet.
name	VARCHAR(50)	Name of the pet.
age	INTEGER(5)	Age of the pet.
gender	VARCHAR(20)	Pet's gender.
birthdate	VARCHAR(50)	Pet's birthday (if applicable)

TABLE 11: PET contains all necessary pet information.

Data Field	Data Type	Description
schedule_appt_id (pk)	INTEGER(5)	Schedule ID.
date	VARCHAR(50)	Date of consultation/schedule.
time	VARCHAR(50)	Time of consultation/schedule.
clinic_id (fk)	INTEGER(5)	Clinic's ID.
vet_id (fk)	INTEGER(5)	Veterinarian's ID.
owner_id	INTEGER(5)	Pet owner's ID.
pet_id	INTEGER(5)	Pet's ID
remarks	VARCHAR(200)	States the reason for visit and reason for disapproved request.
confirmed	INTEGER(5)	Status of request: 1 – Approved, 0 – Disapproved.

TABLE 12: SCHEDULE_APPT contains requested and approved schedule of pet owner in different clinic.

Data Field	Data Type	Description
consultation_id (pk)	INTEGER(5)	Consultation ID.
pet_id (fk)	INTEGER(5)	Pet's ID.
consultation_date	VARCHAR(50)	Date the consultation was done.
diagnosis	INTEGER(5)	Diagnosis for the pet.
remarks	VARCHAR(50)	Other remarks for the pet consultation result.
next_consult_date	VARCHAR(50)	Advised next consultation date for the pet(if necessary)
schedule_appt_id (fk)	INTEGER(5)	Reference to schedule ID.

TABLE 13: CONSULTATION_HISTORY contains all previous consultation record of pet.

Data Field	Data Type	Description
med_id (pk)	INTEGER(5)	Medication control number.
consultation_id (fk)	INTEGER(5)	Reference number from CONSULTATION.
pet_id	INTEGER(5)	Reference for pet receiving the medication.

medicine	VARCHAR(50)	Medicine information.
dosage	VARCHAR(50)	Dosage of medicine.
date	VARCHAR(50)	Date the medication was prescribed.

TABLE 14: MEDICATION contains information for necessary medication for the pet.

Data Field	Data Type	Description
lab_id (pk)	INTEGER(5)	Laboratory control number.
consultation_id (fk)	INTEGER(5)	Reference number from CONSULTATION.
pet_id	INTEGER(5)	Reference for pet undergone laboratory examination.
lab_type	VARCHAR(50)	Type of laboratory examination performed.
lab_findings	VARCHAR(200)	Laboratory findings.
lab_date	VARCHAR(50)	Date the laboratory was performed.

TABLE 15: LABORATORY contains information for laboratory results for the pet.

Data Field	Data Type	Description
vaccine_id (pk)	INTEGER(5)	Vaccine id
consultation_id (fk)	INTEGER(5)	Reference number from CONSULTATION.
pet_id	INTEGER(5)	Reference for pet undergone vaccination.
vaccine_type	VARCHAR(50)	Type of vaccination e.g. for rabies, heartworm
vaccine_name	VARCHAR(200)	Name of vaccine
expiration	DATE	Expiration of vaccine
next_due	DATE	Next due date of vaccine

TABLE 16: VACCINATION contains information for vaccination info for the pet.

E. Technical Architecture

The system is implemented using various technologies available today. The following are list of technologies used in development of this system:

1. Programming Language:

a. PHP 5.5.11

b. jQuery 1.11.0

- c. Java
2. Web Server:
- a. XAMPP 1.8.3
 - b. Apache 2.4.7 or later
 - c. JSON
3. Database:
- a. MySQL 5.0.11 or later

The system is available on Web and Android devices with OS v4.x, and requires internet connection. The system is working and tested using Google Chrome as web browser.

V. Results

A. Web-based application: User Interface

The home page of SpotAVet is shown in Figure 17. In this page, clinic owners may choose to register their clinic to the system, and registered users may choose to login. Initially, only clinic owners could request for a user account. It is then approved by the system administrator.

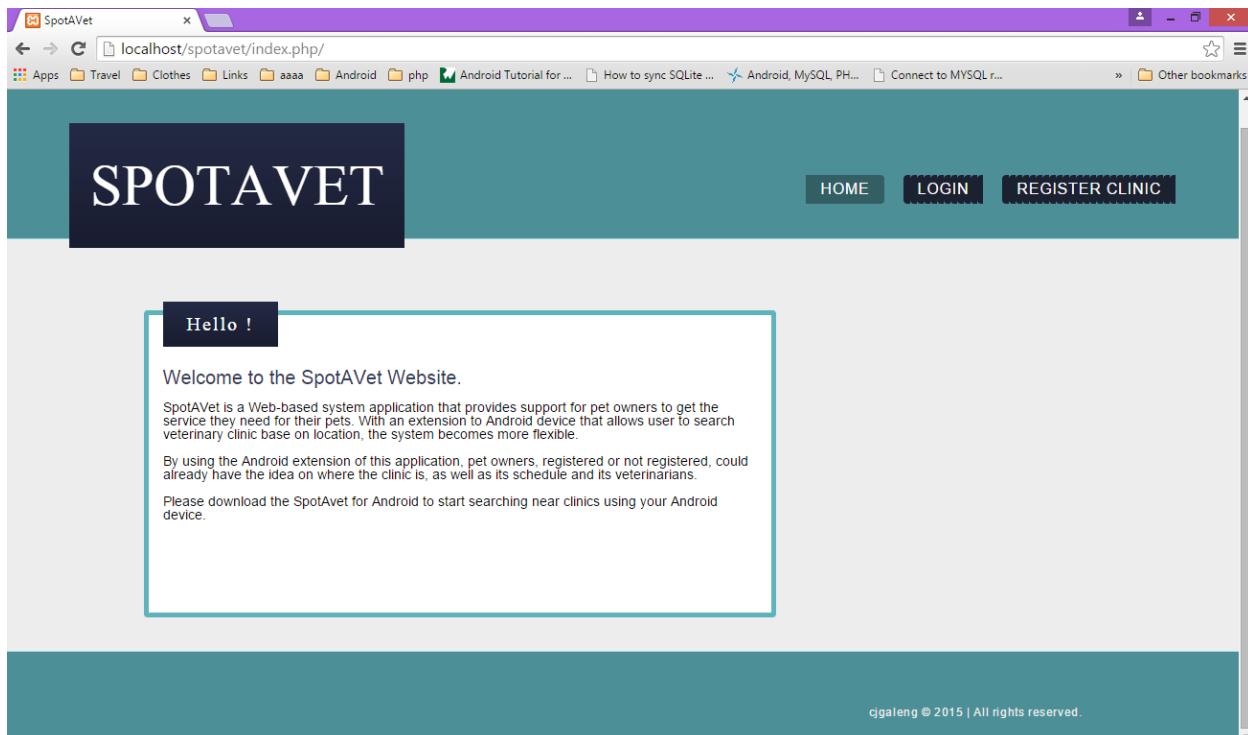

Figure 17. SpotAVet homepage

Upon successful login to the system, users are directed to their specific page based on their roles.

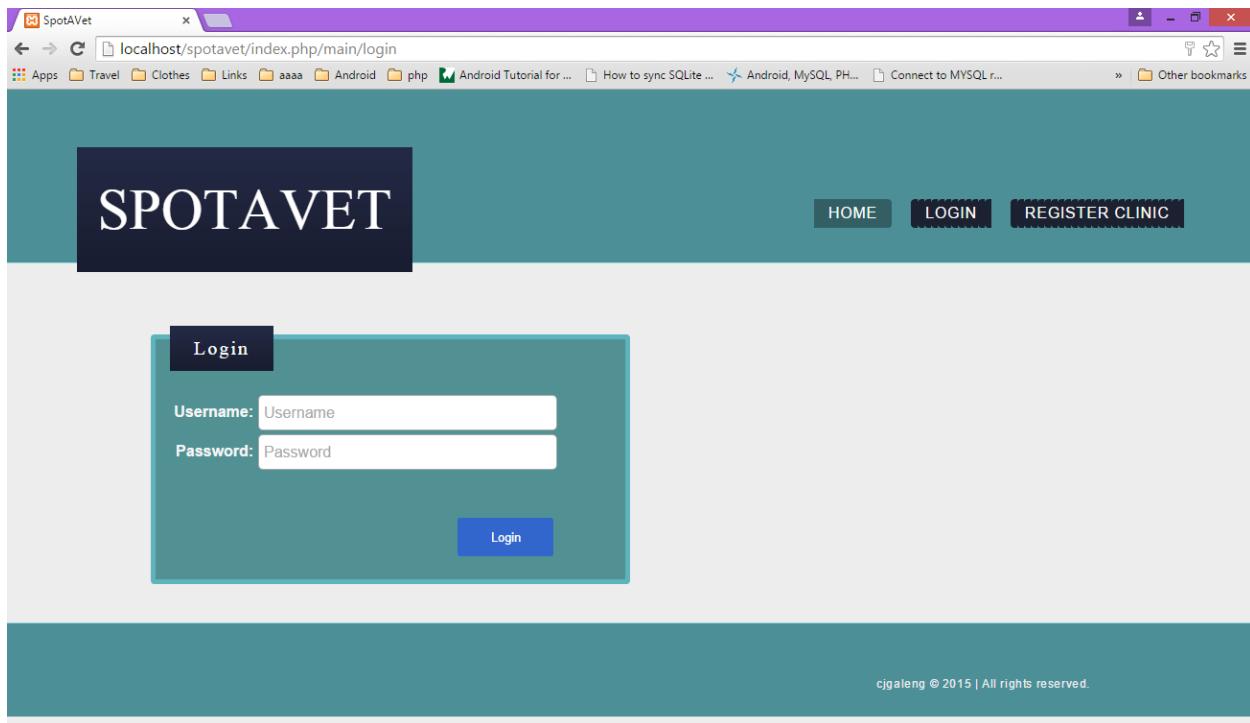

Figure 18. SpotAVet login page

If the user is an administrator, the page for administrator is displayed, as shown in Fig 19

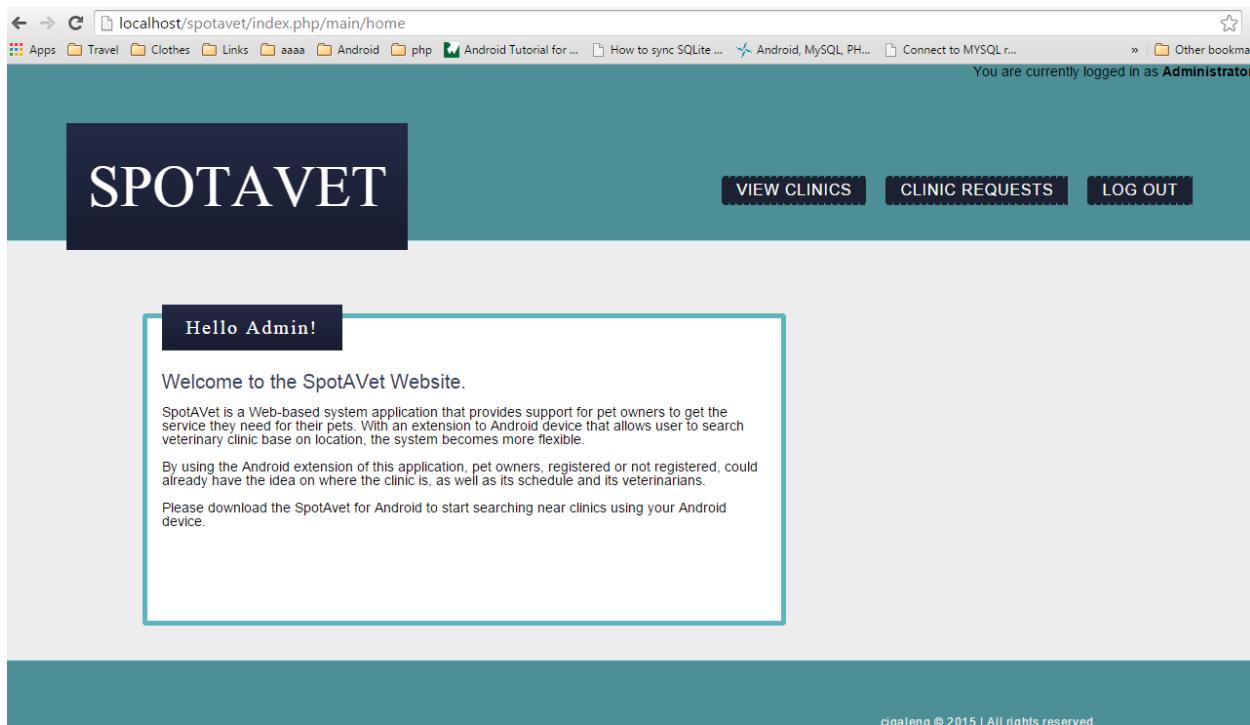

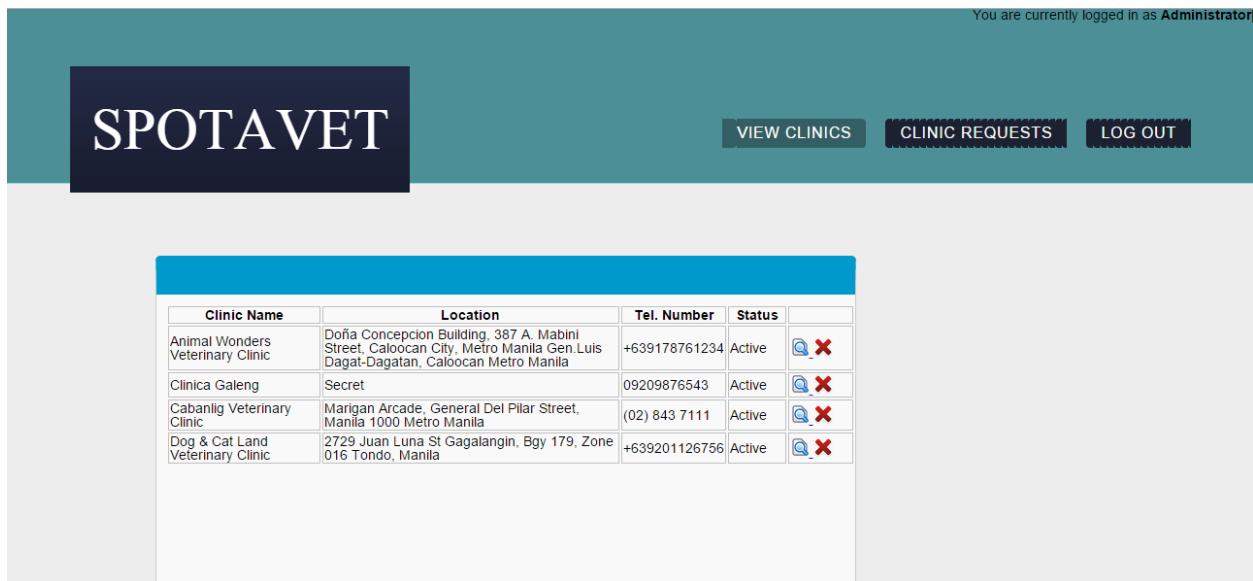

Figure 19. Administrator homepage

Administrator is responsible for approval, activation and deactivation of clinic account.

By Viewing Clinic account the activation and deactivation menu will be available.

In this page, if  is clicked, clinic information is displayed. If either  or  is clicked, the clinic account is activated or deactivated respectively. See Figure 20 as reference.

The screenshot shows the SPOTAVET administrator dashboard. At the top, there is a teal header bar with the text "You are currently logged in as Administrator". Below the header, there is a dark blue navigation bar with the "SPOTAVET" logo on the left and three buttons on the right: "VIEW CLINICS", "CLINIC REQUESTS", and "LOG OUT". The main content area displays a table titled "View Clinics" with the following data:

Clinic Name	Location	Tel. Number	Status	Action
Animal Wonders Veterinary Clinic	Dofia Concepcion Building, 387 A. Mabini Street, Caloocan City, Metro Manila Gen Luis Dagat-Dagatan, Caloocan Metro Manila	+639178761234	Active	 
Clinica Galeng	Secret	09209876543	Active	 
Cabanlig Veterinary Clinic	Marigan Arcade, General Del Pilar Street, Manila 1000 Metro Manila	(02) 843 7111	Active	 
Dog & Cat Land Veterinary Clinic	2729 Juan Luna St Gagalangin, Bgy 179, Zone 016 Tondo, Manila	+639201126756	Active	 

Figure 20. Administrator – View Clinics

When Clinic Requests button is clicked, list of clinics requesting account activation are shown. See Figure 21. Clicking  or  icon will approve or disapprove the request respectively.

The screenshot shows the administrator's clinic requests interface. At the top, a teal header bar displays the text "You are currently logged in as Administrator". Below the header, a dark blue navigation bar features the "SPOTAVET" logo on the left and three buttons on the right: "VIEW CLINICS", "CLINIC REQUESTS", and "LOG OUT". The main content area has a light gray background. It contains a table with two rows of clinic information. The first row includes a "Clinic Name" column with "Dog & Cat Land Veterinary Clinic", a "Clinic Address" column with "2729 Juan Luna St Gagalangin, Bgy 179, Zone 016 Tondo, Manila", and a "Contact No." column with "+639201126756". To the right of these columns are two small boxes: one with a green checkmark and another with a red X. The second row follows the same structure for "Chua Veterinary Clinic" (Clinic Name), "D. Tuazon Quezon City" (Clinic Address), and "+639273287698" (Contact No.), also accompanied by a green checkmark and a red X.

Clinic Name	Clinic Address	Contact No.
Dog & Cat Land Veterinary Clinic	2729 Juan Luna St Gagalangin, Bgy 179, Zone 016 Tondo, Manila	+639201126756
Chua Veterinary Clinic	D. Tuazon Quezon City	+639273287698

Figure 21. Administrator – Clinic Requests page.

If the user is a Clinic Owner, the Clinic Owner homepage is displayed, as shown in Figure 22

The screenshot shows the clinic owner's homepage. At the top, a teal header bar displays the text "You are currently logged in as Clinic Owner". Below the header, a dark blue navigation bar features the "SPOTAVET" logo on the left and four buttons on the right: "MY PROFILE", "MY CLINIC", "MY VETERINARIANS", and "LOG OUT". The main content area has a light gray background. A prominent feature is a teal-bordered box containing a welcome message. The message starts with "Hello Clinica!" followed by "Welcome to the SpotAVet Website." It explains that SpotAVet is a Web-based system application that provides support for pet owners to get the service they need for their pets. It mentions an Android extension that allows users to search veterinary clinics based on location, making the system more flexible. The message also states that by using the Android extension, pet owners, registered or not, can already have the idea on where the clinic is, as well as its schedule and its veterinarians. Finally, it encourages users to download the SpotAVet app for Android to start searching near clinics using their Android device. At the bottom of the page, a teal footer bar contains the copyright notice "cgaleng © 2015 | All rights reserved."

Figure 22. Clinic Owner Homepage

Clinic owners could navigate from personal profile, clinic profile and veterinarians within the clinic. The clinic owner is the one responsible in creating account for every veterinarian working at the clinic.

If the user role is a Veterinarian the vet homepage is displayed as shown in Figure 23.

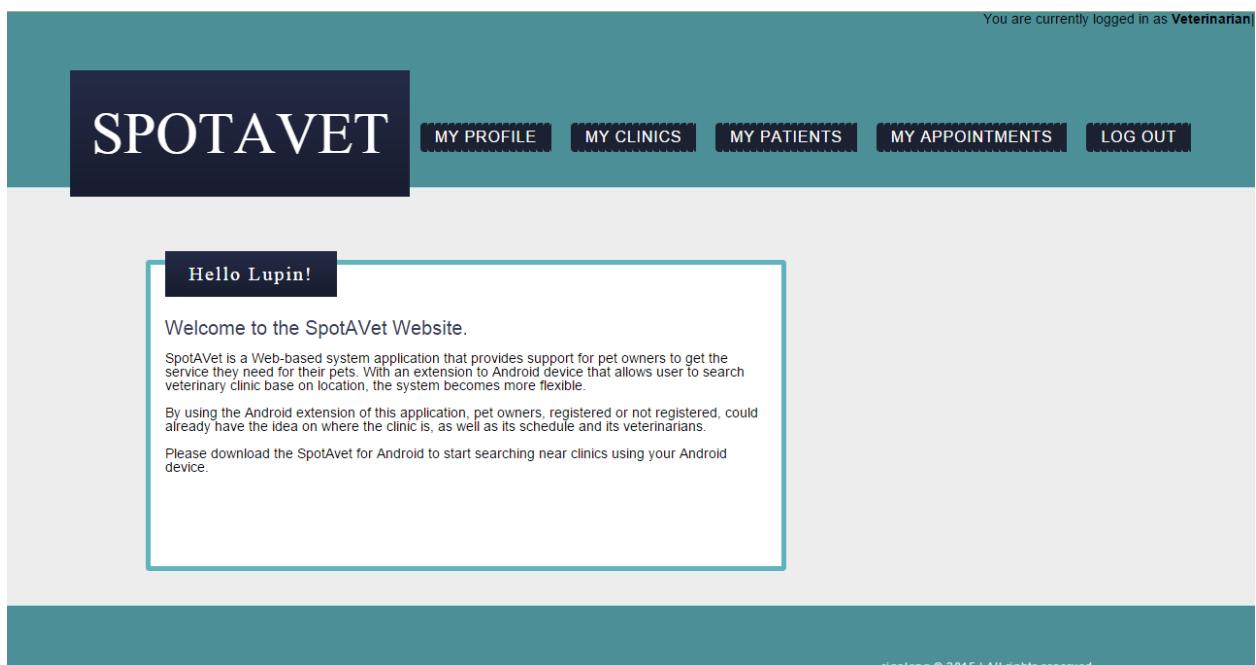

Figure 23. Veterinarian homepage

Just like the clinic owner, Veterinarian could update personal profile and view clinic information, maintains medical record for his/her patient and approve appointment request. Also, Veterinarians are the one responsible in creating account for pet owners and their pets having consultation for the first time. Both pet owners and pet details are added being when creating

account for pet owners. Appointment request coming from registered users can be viewed, approve and decline by the veterinarian.

Lastly, if the user is a Pet Owner, they will be able to see their homepage as shown in Figure 24.

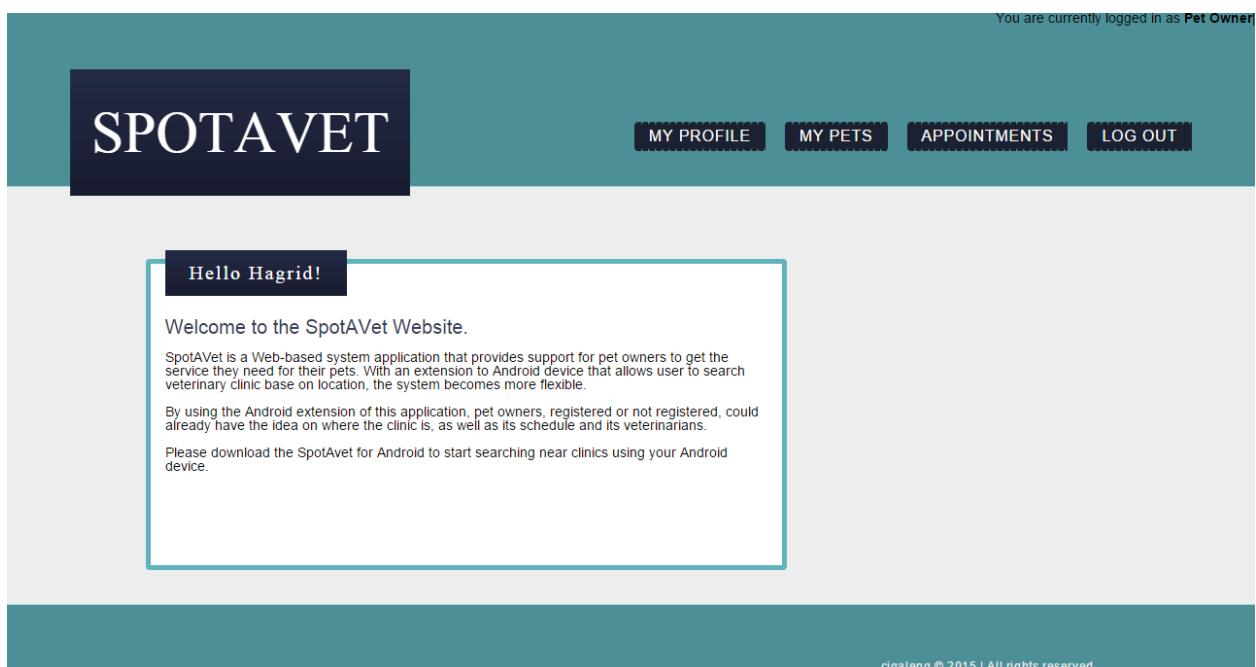

Figure 24. Pet owner homepage

View and update of own profile and pet information are the main functionality the owner can do. Once account as pet owner was created, scheduling appointment via web will now be available for use.

B. Web-based application: System Functionality

Only clinic owners can apply for account for the system. By using the form shown in Figure 25, any clinic owner could request for account to the system.

Registration Form

Clinic Location Details

A Google map showing the location of the clinic. The map is centered on a red marker located on Karuhatan Rd. in the Kardahan area of Valenzuela City. The map shows surrounding streets like San Guillermo Street, Gov. L. Santiago St., and SM Supercenter. A yellow route line is drawn from the top left towards the center. Various landmarks are labeled, including PNR Valenzuela, Valenzuela City Hall, and SM Supercenter. The map includes zoom controls and a legend.

Lat: 14.888242 Lng: 120.9789202

Register!

Figure 25. Clinic Request Form

It will then need to be approved by system administrator. Once approved, veterinarian account could now be created by the registered clinic. Only registered clinic can create new veterinarian account with the use of the form shown in Figure 26. Accounts created for veterinarians are pre-approved by the system and can already be used. It is advised to change password after initial login to the system. Any user can change password by editing his/her own profile.

The screenshot shows a web browser window for the 'SpotAVet' application. The title bar reads 'SpotAVet' and the address bar shows 'localhost/spotavet/index.php/main/add_veterinarian'. The main interface has a dark blue header with the 'SPOTAVET' logo on the left and navigation links 'MY PROFILE', 'MY CLINIC', 'MY VETERINARIANS', and 'LOG OUT' on the right. Below the header is a light gray content area containing a form titled 'Veterinarian Info'. The form includes fields for 'Username', 'Password', 'Confirm Password', 'Email Address', 'Last Name', 'First Name', 'Middle Name', 'Contact No.', and 'License No.'. There is also a section for selecting animal types with checkboxes for 'Canine', 'Avian', 'Equine', 'Feline', 'Reptiles/Amphibians', and 'Lagomorph'. At the bottom of the form is a 'Schedule' field and a blue 'Add Vet' button.

Figure 26. Add New Veterinarian Account form

In cases where the veterinarian has already an account and would only join a new clinic to offer their services, clinic owner could search veterinary name or email, set up the schedule and add the vet on clinic's vet list. See Figure 27.

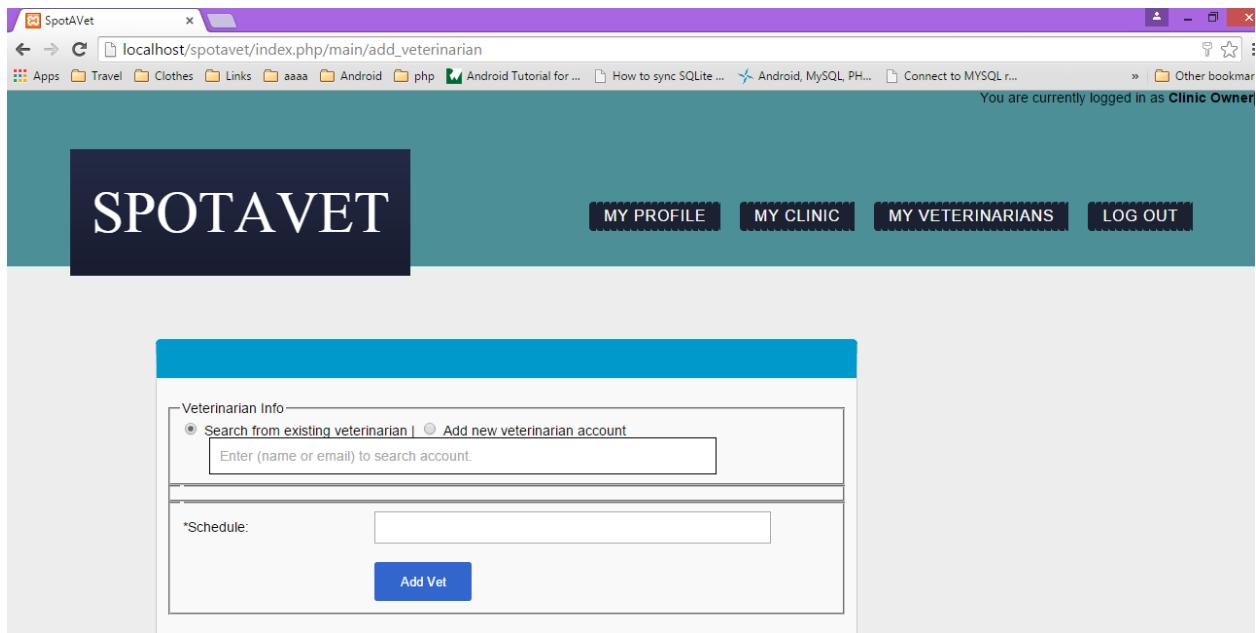

Figure 27. Add Veterinarian from list of existing veterinarians

As stated, veterinarian account is a pre-approved account, thus after successful registration, veterinarian could already use the system. As a veterinarian, they are responsible in maintaining the pet medical record for their patients. Every after consultation, veterinarians will add the result of consultation to the system, result of laboratory if there is any and medication details as well as vaccination history. In cases where the client/pet owner does not yet have the

account for the system veterinarians can create account for owner and profile for the pet. Refer to Figure 28 and Figure 19 respectively;

The screenshot shows the SPOTAVET application interface. At the top, there is a dark blue header bar with the 'SPOTAVET' logo on the left and four navigation tabs on the right: 'MY PROFILE', 'MY CLINICS', 'MY PATIENTS', and 'MY APPOINTMENTS'. Below the header, the main content area has a light gray background. A large, semi-transparent teal overlay covers the center of the page. This overlay contains a form for adding patient consultation details. The form is divided into sections: 'New Patient Record' (with radio buttons for selecting from a list or adding a new owner), a dropdown menu for 'Clinic' (set to 'Animal Wonders Veterinary Clinic'), and 'Consultation Details' (which includes fields for 'Consultation Date' (mm/dd/yyyy), 'Chief Complaints', 'Diagnosis/Findings', 'Other Remarks', and 'Next Consultation Date' (mm/dd/yyyy)). At the bottom of the overlay, there are four blue buttons labeled 'Medication', 'Vaccination', 'Laboratory', and 'Submit'.

Figure 29. Add new patient form

Pet owners that already have access to the system should register all his pets to the system for the veterinarian. Pet owners are responsible on updating personal info as well as pet information. When adding and updating the pet information, the form to be used is shown in Figure 30.

The screenshot shows a web browser window titled "SpotAVet" with the URL "localhost/spotavet/index.php/main/add_pet". The page has a teal header with the "SPOTAVET" logo and navigation links for "MY PROFILE", "MY PETS", "APPOINTMENTS", and "LOG OUT". The main content area is a form titled "Pet Information" with fields for Name, Species, Breed, Birth date, Gender, and Registration No., along with a "Save" button.

Figure 30. Add Pet form.

Pet owners can also utilize the set appointment feature of the system. This will set up appointment schedule for the desired clinic or veterinarian. Only the veterinarian chosen from the selection will see the details of the request. See Figure 31 to have an idea how appointment is requested.

The screenshot shows a web browser window for the 'spotAVet' application. The title bar indicates the URL is 'localhost/spotavet/index.php/main/appointment_request'. The top navigation bar includes links for Travel, Clothes, Links, aaaa, Android, php, and several others related to Android and MySQL. A message at the top right says 'You are currently logged in as Pet Owner'. The main header features the 'SPOTAVET' logo. Below the header, there are four buttons: MY PROFILE, MY PETS, APPOINTMENTS, and LOG OUT. The central content area is titled 'APPOINTMENT REQUEST'. It contains a search bar with placeholder text 'Enter name to begin search.' and a dropdown menu set to 'Clinic'. A dropdown menu for 'VETERINARIAN' is also present. Below these, fields for 'PET NAME' (set to 'fluffy'), 'DATE' (set to '06/15/2015'), and 'TIME' (set to '01:44:02 PM') are shown. A text input field for 'REASON FOR VISIT' with placeholder text 'State reason for appointment.' is included. At the bottom left of the form is a blue 'Submit Request' button.

Figure 31. Request appointment form

C. Android-based application: Functionality

One of the unique features of mobile application is location awareness. SpotAVet for android starts with the current location of the user. The search could be triggered at start to check if any registered clinic is nearby. If none, you could either zoom out to widen the search perimeter or touch in the map the location you want to start the search. See Figure 32 for reference on how the UI looks like.

Figure 32. SpotAVet android

The application would notify the user if a clinic has been found or not. By clicking the marker on the map, the name of the clinic would pop up. See figure 33 for reference.

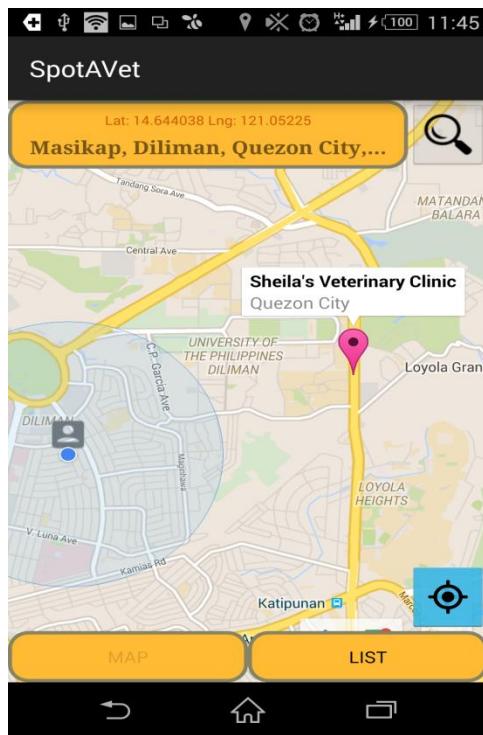

Figure 33. SpotAVet Android: Clinic found

Tapping on the name of the clinic would give you the complete information about the clinic. If no list of veterinarian is shown it means that the clinic has not added any veterinarians on clinic profile. Tapping on the name of a veterinarian on list would give the user the complete profile of the vet. See Figure 48 and Figure 49 for example.

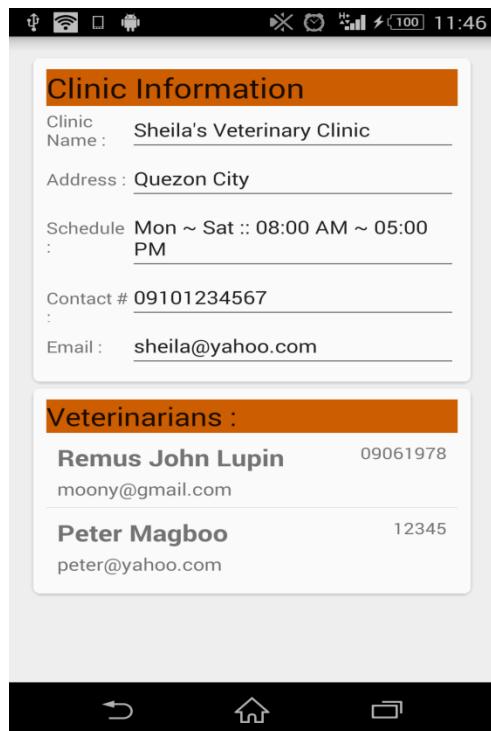

Figure 34. SpotAVet android: Clinic Information

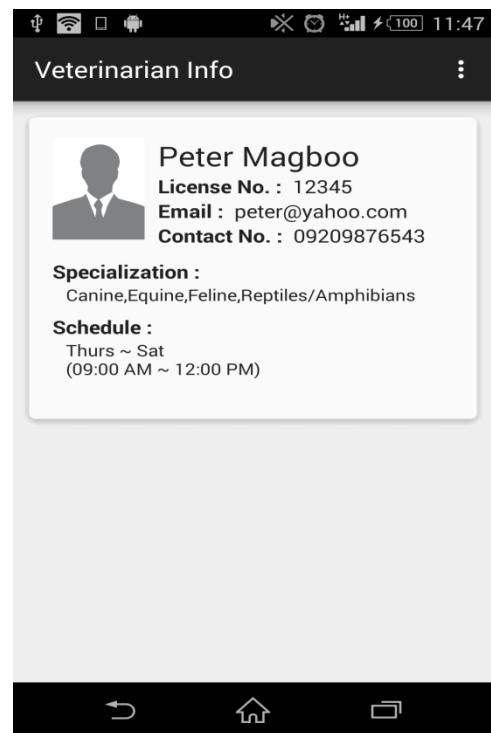

Figure 35. SpotAVet android: Veterinarian Information

VI. Discussion

SpotAVet is a Web-based system application that provides support for pet owners to get the service they need for their pets. With an extension to Android device that allows user to search veterinary clinic base on location, the system becomes more flexible. Even though the main functionality such as registration, appointment request and storage of pet medical record are only available on Web, by using the Android extension, pet owners, registered or not registered, could already have the idea on where the clinic is, as well as its schedule and its veterinarians. Furthermore, information about veterinarians schedule and specialty are also provided.

Aside from the information about the clinic and veterinarians, the system also provides the capability to store pet medical records. Consultation result, medication given, and laboratory results are examples of data the system stores as part of pet medical record. But, this information is only available to both pet owners and veterinarian for confidentiality.

Interested clinic could request for account to gain access to the system, this is done so that administrator of the system have time to investigate legitimacy of the clinic applying for system use. After the clinic account has been approved by system administrator, the clinic owner could now add veterinarian account for veterinarians working in their clinic. Veterinarians could later on create account for pet owners which would later on use the system for adding pet information and appointment request.

To ensure that all clinic data are correct, System Administrator was given the privilege to activate or deactivate a clinic account. In cases for example, if the clinic closes or stopped their operation the system admin could immediately deactivate its clinic account.

VII. Conclusion

Utilizing the features provided by SpotAVet, with support from various veterinary clinics, veterinarians and pet owners could improve the way we deal with some of the problems associated with animals and pets. Getting the help we need when we need them, and the information when we need them can be a key in solving problems associated with pet and animals on our community.

Also, SpotAVet, when enhanced, could greatly improve the way we handle pet medical record. When this records are properly handled, it could soon be reused by veterinarians and improve the way to deal with various diseases that pets or animals are suffering.

Furthermore, SpotAVet can also be used as template or reference for other similar applications. As a location based application that works both in Web and Android platform it can be considered as framework when developing similar applications. With the use of this kind of application we could revolutionize the way we search and explore things.

Finally, with the use of current technology where fast and reliable information are greatly in demand, use of mobile devices to access this information is crucial.

VIII. Recommendations

SpotAVet allows pet owner to search by clinic name or veterinarian name and email address whenever they want to set appointment. Improving the search option to more advance, like by specialization or clinic services, would greatly improve the benefit users could attain by using the system. Also, enabling the Android extension to allow setting-up appointment would be a great feature in the future.

The current scope of the system is limited to veterinary clinic that is servicing outpatient request, adding option for veterinary hospitals and inpatients services would broaden the scope. This would give users more diverse selection and information when using the system.

Having a standard or more comprehensive form of capturing pet information and record would greatly improve the information the system could provide its users. Identifying sensitive information and doing encryption would secure users information and could boost confidence in using the system.

<div class="homepage">
    <h2>Hello <?php echo
$this->session-
>userdata('username');?>!</h2>
    <h3>Welcome to the
SpotAVet Website.</h3>
    <p>
        SpotAVet is a
Web-based system application that provides
support for pet owners to get the service
they need for their pets. With an extension
to Android device that allows user to search
veterinary clinic base on location, the
system becomes more flexible.
    </p>
    <p>
        By using the
Android extension of this application, pet
owners, registered or not registered, could
already have the idea on where the clinic
is, as well as its schedule and its
veterinarians.
    </p>
    <p>
        Please
download the SpotAVet for Android to start
searching near clinics using your Android
device.
    </p>

XI. Acknowledgement

Yehey! It's my turn now to say "Finally"! Yehey dahil siyempre FINALLY tapos ko na lahat ng comsci subjects ko, konti na lang graduation na weee.. after many years. Also happy ako kasi freestyle ang page na to, ubos na ubos na kasi English ko from the previous pages. ☺ My Special Problem is indeed an accomplishment for me. Para sa tulad ko na hindi magaling sa write-ups, natapos ko ito.. So happy.

Firstly, I would like to give my big thanks to my adviser Ma'am Sheila, sobrang thank you po sa paulit ulit niyong pagtanggap sa akin, kahit minsan isang taon bago ako magpakita ulit sa inyo. Hehe. Isa po kayo sa nakapagpa push sa akin na tapusin ito. Yung mga words niyo po nakakatulong, though mahina pa rin po talaga ang loob ko sa ganito. Ayuuun tapos na po ang lahat ng '08 advisees niyo ☺

Sa blockmates ko, salamat sa friendship and everything, nung undergrad years natin or should I say nung may klase pa tayo. Naenjoy ko ang college life dahil sa inyo. ♥ I admit na hindi ako masyadong nagpapakita after our supposedly graduation year. Miss na miss ko na kayong lahat. Pagkatapos nito, sana naaalala niyo pa din ako. Dahil... sasama na ko sa mga outings, YAY. Tagal ko na naiinggit gusto ko talaga sumama ☺ Thank you mommy JJ, Auradee lobster, sa paulit ulit na pag-aya sa akin kahit ang madalas kong sagot ay no. Tina, Hii Rialabs!!!! Kayo yung mga paulit ulit nangangamusta sakin kahit di ako nakakapagreply. See you soon. Eulahhhpot, uwi ka na ulit dito sa Pinas. Hehe

Ate Naji, JM, Gela, Patrick, Luwi, Ian, magkikita tayo after this.. I insist. I need to catch up with you guysss. Pero sagot niyo muna food and "tea?", bigtime na kayo e :D

Keisha, Lorielyn, Axl, thank you din sa pag motivate sa aking tapusin to, I will meet you all soon. ☺

Mica, piggie frieeend, thank you ng marami sa morale support, food support, words support sa pagsusulat ng papers, haha lahat na. You've been there for me from the start of my final topic (haha) and never left me, kahit ilang breakdown na at pagpapanic na ang nangyari sa akin. Your friendship means so much to me. Ililibre kita after this, woo.

And last, but not the least, to my dearest family..

Gillian, (yehess naman special mention) thank you sa pagpapahiram mo ng laptop, sobrang tagal na din pala to nasakin. At kita mo na, pati yung laptop ang lawak na ng ngiti for me. Ipapaayos ko na lang to pag kaya pang ayusin. Goodluck sa remaining years mo sa BS Nursing. Mag grad ka ng regular ah, sumablay ka sa 2017, wag mo ko tularan hehe. Make us proud! Love you, Gillian :P

Mama, Tatay, eto na po, pagkatapos ng ilang taon niyong pangungulit, this is for you. Kahit nagtampo po ako nung una kasi pinagresign niyo ako para tapusin ang SP, ehh gusto ko pa nga magwork. Pero narealize ko naman para sakin din talaga yun, para magkaroon ako ng diploma. Salamat po sa lahat, sa pagpapaaral, sa allowances, sa trust. Mama, sorry kung wala ako masyado time makipag-usap sa bahay lately. Pero thank you sa paglalaba ng ilan kong gamit lately, dahil wala na akong time maglaba. I love you mama. ♥ Be strong, and always be healthy, Mama. Masusuot mo na yung mga binili mong damit, mama donya. Advanced happy birthday gift ko muna sa'yo to. Next time na iphone okay? Heehhe

Tay, I think this is the best gift I could give you on Father's day. Lolol. Eto sana yung birthday gift ko sa'yo.. kaso naudlot. Hehe ang mahalaga naman po diba tapos na? Diba po? Hehe. Finally eto na po nakapagpatapos na kayo. Eto na po yung dream niyo na makagraduate. I love you, tatay. ♥
